Dear readers,

We are always making decisions – in every minute of every hour of every day. At this moment, you have decided to open our catalogue to consciously find out more about our company aquatherm.

Without knowing the reason behind your decision, we can promise you one thing, namely that the insight into our colourful, yet always slightly green tinged, aquatherm world is sure to impress you!

As a family business which is passionate about all it does we, together with our employees, confidently meet all challenges and, in doing so, are able to trustfully call upon values which have defined our company for already more than four successful decades.

We know where we want to go without forgetting where we came from. Hereby we like to live with the role of not being a “normal” business. The characteristics “being different” and “special” represent our motivation in all that we do to be the best.

We are “state of the pipe” because we act independently and decisively and are hereby always reliable which makes us the leading manufacturer of polypropylene pipes.

We were, are and will remain as this – promise!

But see for yourself and decide upon aquatherm not only in the next few moments but also in the long term.

Best wishes

Dirk Rosenberg
Managing Director

Managing Director

Gerhard Rosenberg
President of the Advisory Board

- 1973 aquatherm founded by Gerhard Rosenberg
- 1977 First exports to Jordan and Belgium
- 1978 Move to the first building at the current site in Biggen
- 1984 Opening up of further foreign markets including Italy and Greece
- 1990 Market launch of the fusiotherm stabi composite pipe
- 1991 Subsidiary plant opens in Radeberg
- 1996 Takeover of turning shop aquatherm Metall GmbH & Co. KG, Attendorf
- 1996 First certification of our quality management system in accordance with ISO 9001
- 1997 Independent sales in Italy
- 1999 Market launch of the fusiotherm fibre composite pipe
- 2001 aquatherm operates in more than 50 export markets
- 2004 Dirk and Maik Rosenberg join management
- 2005 Market launch of the aquatherm black system
- 2006 Market launch of the aquatherm blue pipe
- 2006 aquatherm products permanently represented on all 5 continents
- 2008 Market launch of the aquatherm red pipe
- 2010 System expansion of the pipe size to max. ø630 mm
- 2010 Dirk, Maik and Christof Rosenberg assume company management
- 2011 Market launch of aquatherm ti
- 2012 First time certification of our environment management system in accordance with ISO 14001
- 2012 Market launch of the material PP-RP
- 2013 First certification of our energy management system in accordance with ISO 50001
- 2013 Brand conversion “colours of innovation” and aquatherm 40th jubilee
- 2015 Independent sales in North America
- 2017 Opening of the new pipe extrusion
- 2018 Independent sales in England
- 2018 Move of the injection moulding department to the new hall complex

Field staff

Whether briefing on site, system briefing in your workshop or counter events and tool days at the specialized trade: In addition to the regular training in Attendorn, the aquatherm field staff is every day and everywhere in Germany on the way.

A list of our globally active partners can be found on our website www.aquatherm.de in the category „service“.

Training

In addition to the proven lectures and counter events in the specialized trade and the training at the guild associations, aquatherm regularly offers specialist seminars and information events at the training center in Attendorn.

Fairs

aquatherm is represented with its own booth at all important fairs relevant for the heating and sanitary sector in Germany and abroad. Information regarding exact dates in your area can be found on the internet at www.aquatherm.de in the „service“ area.

Certifications in accordance with ISO 9001, 14001 & 50001

Since 1996 aquatherm fulfills the requirements of the quality management system according to DIN ISO 9001. The 2012 TÜV certificate was extended by the environmental management system according to ISO 14001 and currently by the energy management system according to ISO 50001.

This success is another step towards strengthening our competitive position and to meet the high requirements and the responsibility for our customers, partners and the environment.

REBRANDING

The desire to avoid stagnation and continuously improve our products, as well as to find new fields of application and create solutions quickly, has resulted in some of the well-known aquatherm product groups. This often led to systems being named as they emerged and has resulted in naming conventions that no longer accurately convey the suitable applications for the pipe.

Another issue was that many of our pipes and systems have names that

do not relate to each other, and in turn do not relate those products to their parent company, aquatherm. Furthermore, other companies from different industries around the globe use similar names, creating confusion between aquatherm products and their products. The desired uniqueness of our system identification was lost.

Thus, the next logical step for us was to introduce a naming system that matches and unifies our products.

aquatherm green pipe

aquatherm green pipe

The innovative all-rounder, which revolutionized the plastic pipe sector, made a name for itself within a very short time that stands for highest quality and outstanding ecological properties. The system has proven its excellent technical suitability in more than 30 years of application worldwide, and among experts has long been one of the most extensive and at the same time best plastic pipe systems.

The system includes the different types of pipes SDR 6, SDR 7.4, SDR 9 and SDR 11. These are supplemented by the especially reinforced fiber composite pipe. More than 450 joining and connection elements as well as valves and ball valves complete the system.

The products are available from 16 mm to 450 mm external diameter.

aquatherm green pipe SDR9 RP

aquatherm sets the innovation standards in the production of PP-pipes and fittings worldwide. We continually bother to push developments for product improvement. The current level of evolution is called „fusiolen PP-RP“.

With „fusiolen PP-RP“ we can produce fibre-composite pipes with lower wall-thickness by keeping all the well-established advantages. Further advantages can be found on page 29.

The aquatherm green pipe system is applied in all fields of

- **NEW INSTALLATION**
- **REPAIR** and
- **RENOVATION.**

- **Potable water pipe networks**
cold and hot water installations e.g. in residential buildings, hospitals, hotels, office and school buildings, shipbuilding, sports facilities etc.
house connection
boiler connection
water distribution
rise
high rise (conventional or specially connected)
water point connection

- **Heating pipes for residential houses**
heat generator connections
heating manifolds
risers
high rise
manifold connections
radiator connections

- **Pipe networks in agriculture and horticulture**

- **Pipe networks for geothermal recovery**

- **Pipe networks for industry,**
the transport of aggressive fluids
(acids, leys etc.) considering the chemical resistance

Fields of application

aquatherm green pipe

POTABLE WATER AND HEATING INSTALLATIONS

From the house connection station, cold water distribution, boiler connection and hot water distributor to risers, installed with aquatherm green pipe composite pipe, with conventional high rise or high rise carried out with the aquatherm green pipe manifold system up to the last tap, installed conventionally or with the manifold, concealed or surface installation – the aquatherm green pipe system offers all possibilities of a complete installation with only one non-polluting material.

Types of installation

The aquatherm green pipe system is applicable for all common types of installation:

It is also possible to prefabricate pipe and fittings for risers and high rise.

aquatherm green pipe offers the perfect program for all types of installations.

With an extensive product range of pipe and fittings from Ø 16–450 mm external diameter and more than 450 fittings including fittings with brass threaded metal inserts, aquatherm green pipe offers ideal solutions for all fields of application.

House connection station

Surface installation

Concealed installation

Surface installation

Distribution network for domestic water and heating in residential buildings

All risers and distribution pipes are planned and assigned as usual.

1. Distribution piping with composite pipes

More dimensionally stable pipes are recommended for conventionally installed basement pipes, risers and multi storey pipe-systems.

Multi-storey installation can be done with the distribution blocks for plumbing and heating: quick processing is guaranteed.

Due to the low demand in fittings, the number of connections is reduced and thus time for installation.

High degree of pre-fabrication:

the special construction allows floor or wall installation (e. g. behind skirting boards) as one compact fitting with all branches provided.

2. Floor distribution with distribution blocks

The distribution blocks also offer further installation options: A simple opening of a side branch by drilling (18 mm borer) enables the connection of an additional pipe. e.g. the circulation pipe.

For further information concerning the distribution block plumbing and heating see page 93–95.

IMPORTANT:

The aquatherm grey pipe domestic water and radiator connection system is compatible with the aquatherm green pipe system.

Distribution piping

Floor distribution with distribution blocks

aquatherm grey pipe connection

aquatherm blue pipe

aquatherm blue pipe

aquatherm blue pipe, our specialty for distributing cooling and heating in closed and open systems as well as in several industrial applications. It was developed in order to prevent corrosion in heating system pipes and in cooling and refrigeration systems and quickly expanded its range of application, with many positive features for other fields of piping installation. It has gone on to find success around the world in hotels, stadiums, schools, offices, and industrial applications. In addition to the general advantages of the PP-R pipesystem aquatherm blue pipe in comparison with the aquatherm green pipe system it offers higher volumetric current values due to smaller wall thickness.

System components

The system has to be installed in combination with the aquatherm green pipe fittings – and includes all elements for the pipe system installation for chilled, hot fluid and various industrial applications.

aquatherm blue pipe stops corrosion damages!

Air conditioning systems (problems with dew-point) installed with steel pipes especially are affected by corrosion at the outer surface of the pipes. aquatherm blue pipe is manufactured from 100 % corrosion resistant materials which increase the life-time of air-conditioning pipe systems considerably.

Insulation against energy loss

Compared to metal pipes aquatherm blue pipes require a considerable thinner insulation.

The aquatherm blue pipe system is applied in all fields of

- **New installation**
- **Repair and**
- **Renovation.**

- **Heating pipes for residential houses**
 heat generator connections
 heating manifolds
 risers
 high rise
 manifold connections
 radiator connections

- **Pipe networks**
 climate technology
 chilled water technology
 swimming-pool technology
 chemical transport
 rainwater application
 compressed air systems
 under-floor-heating-systems
 ship building
 district heating
 geothermal

Fields of application

aquatherm blue pipe

Flange connections and transition joints enable the connection of all components to the central heating system and on the floor.

Risers and distribution piping for heating supply should be planned and installed with aquatherm blue pipe fiber composite pipes.

The connection of floor heating systems or the installation of radiator pipes up to the manifold can also be carried out with aquatherm blue pipe.

Heating and air-conditioning

aquatherm blue pipe includes all pipe installation components for chilled water, hot and various industrial applications. Reduced wall thickness offers higher flow rates and the products are stabilised under heat.

Ice surface cooling

The ice surface cooling system is made of an ideal combination of aquatherm blue pipe and aquatherm green pipe components. For the construction of mobile ice rink surfaces the pipework is completed with aquatherm blue pipe components.

The distribution pipes as well as the manifold connecting pipes are made from aquatherm blue pipes and connected by reverse return (Tichelmann-principle). The weld-in saddle technique, developed by aquatherm, is applied for the production of manifold branches.

Under soil heating

To keep a pitch with natural or artificial turf free from ice and snow aquatherm offers a system to provide an under soil heating efficiently and in consideration of environmental aspects.

The ideal combination of aquatherm blue pipe and aquatherm green pipe compounds creates this condition.

COMPOSITE TECHNOLOGY

FASER COMPOSITE TECHNOLOGY

The composite pipes made in the multi-layer extrusion process produce a higher stability due to the fibre filling in the middle layer. Compared to customary PP-pipes there are further advantages:

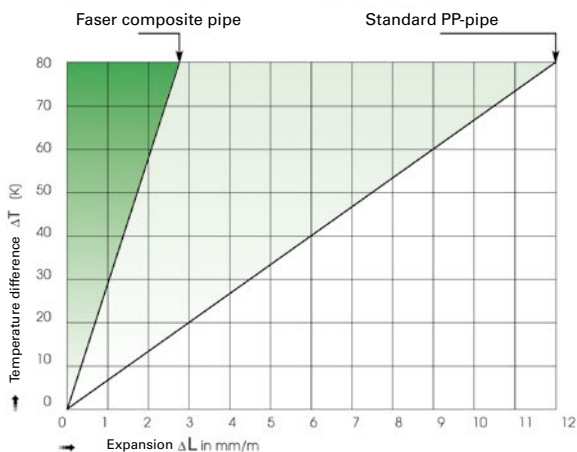

- Reduced expansion
- Higher flow rate due to increased inner diameter
- Greater support spacings
- Less weight

The following types of pipe are produced according to this technology:

- aquatherm green pipe MF (Fasercomposite pipe)
- aquatherm blue pipe MF (Fasercomposite pipe)
- aquatherm red pipe MF (Fasercomposite pipe)

Expansion in comparison

Faser Layer
PP-R-Layer
Oxygen Barrier

aquatherm blue pipe ot

WITH OXYGEN BARRIER!

aquatherm blue pipe ot is an oxygen-tight pipe which is equipped with an oxygen barrier and thus corresponds to the requirements of DIN 4726.

The aquatherm blue pipe faser composite pipe OT in combination with the aquatherm blue pipe system includes all elements for the pipe installation of chilled, hot fluid and various industrial applications.

The advantages of aquatherm blue pipe ot:

- Oxygen tight by diffusion barrier
- Certified according to DIN 4726
- Absolutely corrosion resistant
- Less pipe friction
- High stability
- High heat-stability
- High environmental compatibility
- High impact rate
- Resistant against chemicals
- Heat- and sound insulating characteristics
- Very good welding properties
- Considerably thinner insulation

Easy and quick installation technology

aquatherm blue pipe faser composite pipe OT also convinces by easy but effective installation- and connection technology. By heating of pipe end and fitting the plastic melts after joining of the elements into a permanent connection.

aquatherm blue pipe faser composite pipes OT have to be peeled with peeling tools Art. no. 50479–50488 before processing.

aquatherm green pipe ti

aquatherm blue pipe ti

aquatherm ti – PRE INSULATED PIPE SYSTEMS

for district heating

One of the most energy-efficient methods of transporting hot potable water as well as heating or cooling water covering long distances is the application of underground piping. To achieve the necessary insulating characteristics for this type of application, aquatherm offers the factory-made pre-insulated aquatherm ti pipe system with different medium pipes.

These systems are insulated with closed cell PUR rigid foam and coated with a casing pipe made of HDPE.

All medium pipes are plastic-fibre composite pipes.

The pipe system is optionally also available with trace heating and mains monitoring. Special designs on request.

Medium pipes

- **aquatherm green pipe ti**
faser composite pipe system SDR 9 (7.4 on request available)
pipe system for potable water
in dimensions 32–315 mm
- **aquatherm blue pipe ti**
faser composite pipe system
SDR 11 in dimensions 32–315 mm and
SDR 17.6 in dimensions 160–315 mm
for heating, cooling and waste water
- **aquatherm blue pipe ot ti**
faser composite pipe system SDR 11
oxygen-tight pipe system for heating- and industrial
in dimensions 32–250 mm

MORE INFORMATION

For more information on the aquatherm ti system, please see our aquatherm ti catalogue with the order-no. **E30000**. You can request at our Info-Service on telephone-no. **+49 2722 950-0** or download in the download area of our **www.aquatherm.de**.

RING STIFFNESS OF aquatherm blue pipe & aquatherm green pipe

The aquatherm blue pipes SDR 11 MF (90–400 mm) and SDR 17.6 MF (160–630 mm) have been tested according to DIN EN ISO 9969 with 3 % pipe deformation and have a ring stiffness of $\geq 16 \text{ KN/m}^2$. Thus, they are classified in the ring stiffness class SN16, which corresponds to the highest standard category. The same applies to aquatherm green pipe SDR 7.4 MF (20-355 mm).

Underground installation: The depth of the trench adds up from the depth of the frost line, the outer diameter of the pipe and the height of the bedding ($A+D_a+B$). The frost line must be observed: 0.5–9.0 m above the pipe peak (E). If the pipes are installed outside the specified laying depth, a load distribution by steel or concrete slabs must be installed.

Traffic load: SLW 60, heavy forklift (60 tons maximum load).

Trench design: Recommended calculation according to ATV A 127 (basis for calculation).

Laying conditions: We recommend laying the pipes in a narrow trench in which nevertheless sufficient space for working is available.

Bedding layer (B): In normal soil 100 mm sand with round graining size 0–8 mm.

When rock or rocky soils 150 mm sand with round graining size 0–8 mm.

This layer is equally compressed ($\geq 97 \%$ Proctor) with gaps in the socket area. Non sustainable soils are made stable by the choice of the bedding layer. Note planning requirements.

Backfilling: The building material 4/8 mm graining is filled in layers in order to construct the lateral bedding (C) and the covering (D). Thereby the peak of the pipe (E) is covered with minimum 100 mm. Then the main filling (F) with the excavation can be carried out. Note that the grain size does not exceed 300 mm respectively sharp and rough stones are removed. Planning requirements of the filling levels are always to be considered.

Each filling is compressed separately.

Compaction: The compression ($\geq 97 \%$ Proctor) of the lateral bedding (C) and the covering (D) is done by hand or with light equipment. If the main filling is made with minimum 20 cm, the trench can be compressed 95 % Proctor upwards from this layer with heavy equipment. The last 50 cm of the trench are compressed with 97–100 % Proctor.

aquatherm ti MORE INFORMATION

aquatherm lilac pipe

aquatherm lilac pipe

aquatherm lilac pipe was developed exclusively for the field of water recycling. In countries that are highly committed to the environment, like Australia and California, it is already standard to reduce daily water consumption by using recycled water when possible. Now lilac is also regarded in other countries as a standard colour for greywater pipes.

For technical, commercial, agricultural or domestic applications, cost-effective process water is often required. In the private sector, water recycling-systems are increasingly used. Thanks to the long-lasting and corrosion-resistant material Polypropylene, the aquatherm lilac pipe is ideally suited for process water (grey/rainwater).

System components

The system has to be installed in combination with the aquatherm green pipe fittings – and includes all elements for the pipe system installation for rainwater application and irrigation.

The aquatherm lilac pipe system is applied in all fields of

- **NEW INSTALLATION**
- **REPAIR** and
- **RENOVATION.**

Rainwater application

Irrigation

Agriculture

Faser composite pipe: high working stress at lower wall thickness and higher flow rate

SDR = Standard Dimension Ratio (diameter/wall thickness ratio)

S = single layer

MF = multilayer faser

MF RP = multilayer faser – raised pressure (resistance)

The determination of the allowable pressures resulted from the specific conditions to which pipe system components in the drinking water domestic installation are exposed to.

Limiting factors such as increased flow rates, the use of disinfectants, increased content of oxygen, etc. were considered by the use of the appropriate safety factors.

For fittings of butt-welded pipe segments a reduction factor of 0.75 (reduction of the table values by 25 %) is effective.

PERMISSIBLE WORKING PRESSURE

For heating systems or closed systems considering the seasonal periods of operation – non potable water application

SDR = Standard Dimension Ratio (diameter/wall thickness ratio)
 S = single layer
 MF = multilayer faser
 MF RP = multilayer faser – raised pressure (resistance)

For fittings of butt-welded pipe segments a reduction factor of 0.75 (reduction of the table values by 25 %) is effective.

aquatherm green pipe

Pipe system made of polypropylene
for potable water supply

SDR: 6
ø: 16–110 mm

Type of pipe:
aquatherm green pipe S

SDR: 7.4
ø: 16–63 mm

Type of pipe:
aquatherm green pipe S

SDR: 11
ø: 20–450 mm

Type of pipe:
aquatherm green pipe S SDR 11

ADVANTAGES

Characteristic

aquatherm PP-R-pipe systems stopping corrosion damages. All materials are corrosion resistant and – compared to metallic pipes – have less noise flow rate. aquatherm PP-R-pipes are opaque – no danger of algae development.

Installation

aquatherm offers an unique and unrivalled connection process: material union by fusion. Shortest connection times are convincing:

e.g. outside diameter 20 mm = 8 sec.

aquatherm pipe connections can be hydraulic pressure tested or put into operation directly after their fusion. There are no extended waiting times.

Quality

This is reflected in national and international certificates, but above all in the satisfaction of aquatherm clients, installers and planners. For more details regarding quality and certificates see page 41.

Composite Technology

aquatherm developed a manufacturing method, realizing the integration of a special faser mixture within the material polypropylene.

The result of this innovative technology is the singular compound of the different materials.

- The linear expansion is reduced by at least 75 % compared with standard PP-pipes
- The flow rate is increased by 20 % due to smaller wall thickness
- High stability
- The coefficient of linear expansion is nearly identical to that of metal pipes, so that compared with usual plastic pipes the support intervals can be enlarged and the number of clamps can be reduced
- Optimum cost-performance ratio
- Lower weight
- High impact rate
- Simply cut and weld

aquatherm blue pipe

Pipe system made of polypropylene
for chilled, hot fluid and various industrial applications

SDR: 11
ø: 20–32mm

Type of pipe:
aquatherm blue pipe S

SDR: 7.4 / 11 / 17.6
ø: 20–630 mm

Type of pipe:
aquatherm blue pipe MF

SDR: 7.4 / 11
ø: 20–250 mm

Type of pipe:
aquatherm blue pipe MF OT

SDR: 7.4 / 9
ø: 20–355 mm

Type of pipe:
aquatherm green pipe MF

SDR: 7.4 / 9
ø: 20–355 mm

Type of pipe:
aquatherm green pipe MF UV

SDR: 9
ø: 32–315 mm

Type of pipe:
aquatherm green pipe MF TI

Advantages PP-RP

- Lower wall-thickness
- 14 % higher flow rate at same velocity compared to faser composite pipe SDR 7.4
- The permissible working pressures are on the same level like those of PP-R-faser composite pipes SDR 7.4 or are even exceeding them in the higher temperature range
- Identical expansion as faser pipe SDR 7.4
- 16 % lower weight than faser composite pipe PP-R SDR 7.4
- Lower weight than stainless steel, steel and copper pipes, thereby easier handling for transport and at site
- Quicker processing by shorter butt-welding times
- Trouble-free welding with all aquatherm PP-R-fittings

Guarantee

As a statement to aquatherm quality standards the aquatherm PP-R-pipe systems carries a 10 year guarantee for pipe and fittings with a product liability of 20 Mio. EUR per damage event.

Price

aquatherm PP-R-pipe systems are perfected pipe systems of high quality material with an optimum cost-performance ratio.

SDR: 7.4 / 11 / 17.6
ø: 20–630 mm

Type of pipe:
aquatherm blue pipe MF UV

SDR: 7.4 / 11 / 17.6
ø: 32–315 mm

Type of pipe:
aquatherm blue pipe MF TI

aquatherm lilac pipe

Pipe system made of polypropylene for reclaimed water

SDR: 7.4 / 11
ø: 20–125 mm

Type of pipe:
aquatherm lilac pipe S

The advantages

of aquatherm pipes and fusiolen® PP-R:

- Absolutely corrosion resistant
- Resistant against chemicals
- High environmental compatibility
- High impact rate
- Less pipe roughness
- Heat and soundinsulating characteristics
- Very good welding properties
- High heat-stabilized
- Noticeable less insulation – recommended are 10 mm of insulation for all pipe dimensions
- High stability
- Lighter in weight
- Easy processing
- Well-priced
- Installation aids and fixings

fusiolen®

OUR MATERIAL FUSIOLEN PP-R

Decades of experience in the production and the application of PP-R-pipe systems and the current ambition of continuous development led to numerous improvements of the aquatherm system technology.

Newly opened markets set a high standard of quality to make even larger demands against the pipe material. Various fields of application require the greatest possible independence of the material to be processed. Raw materials with new properties are required. aquatherm has developed and produced their own, innovative PP-R-materials which meet the requirement of a global market in the potable water and heating technology, in the airconditioning and chilling engineering, in the industrial and agriculture economy, in shipbuilding as well as in fire protection. Successful results of this research are fusiolen® PP-R, fusiolen® PP-R C or fusiolen® PP-R FS.

All aquatherm PP-R-pipes and fittings are made of fusiolen® PP-R.

Special heat and extraction stability are only two of the features of this material. Its physical and chemical properties are well-suited to the transfer of potable water and to the heating field. Above all, the good welding properties and fusion, resulting in a permanent connection, have made the aquatherm systems and the raw material fusiolen® PP-R well known worldwide.

Environment

The environmentally friendly material polypropylene fusiolen® PP-R is recyclable and can be ground, melted and reutilised for various applications e.g. motor-protections, wheel linings, laundry baskets and other kinds of transport boxes. There are no polluting substances with PP-R either in its processing or in its disposal.

fusiolen® PP-R – for the benefit of our environment!

Use of metal deactivators

By adding suitable food-approved additives the risk of amaterial damage caused by metal under extreme conditions of application is substantially reduced.

Higher long-term heat stabilization

The long-term heat stabilization has been increased to resist to the potential effects of peak temperatures within higher safety parameters.

MATERIAL PROPERTIES

Potable water is one of the most controlled commodity goods. The domestic supply system should influence the water on its way up to the taps as less as possible. The choice of the right potable water pipe system and its material is of decisive importance.

aquatherm green pipe systems are suitable for all different qualities of potable water. The environmentally friendly and hygienically enhanced potable water pipe system made from fusiolen® is physiologically and microbiologically harmless. The technical suitability of the aquatherm pipe systems has been evident worldwide for decades.

The extrapolated service life of aquatherm PP-R-pipes is more than 50 years. Peak temperatures of 100 °C arising from short disruptions are unproblematic. Permanent temperatures from 70°C up to 90 °C reduce the service life of the pipe (see table “Permissible Working Pressure”, page 25–27).

Using aquatherm PP-R-pipes for heating or air conditioning applications the pressure- and temperature conditions according to table “Permissible Working Pressure” are valid. The following table shows the operating conditions related to pressure and temperature as a basis for pipe and pipe connections. These figures refer to potable water installations based on a theoretical service life of 50 years.

	Working pressure bar (psi)	Temperature °C	Annual working hours h/a
Cold water	0 up to 10 (145) transient	to 25 (77) *	8760
Hot water	0 up to 10 (145) transient	to 60 (140) to 85 (185)	8710 50

* Reference temperature for the creep rupture strength: 20 °C (68 °F)

HYGIENIC SUITABILITY

According to DIN 1988 T2 all installation parts coming directly in contact with potable water are commodity goods acc. to the Law for Food and Commodity Goods. Plastic pipes have to comply with the KTW-recommendations of the Federal Public Health Department.

Certificates

Numerous international certificates testify to the high quality standard of the green pipes.

- DVGW, SKZ, HIG** (Germany)
- AENOR** (Spain)
- ÖVGW** (Austria)
- WRAS** (UK)
- SAI-Global** (Australia)
- CSTB, CARSO** (France)
- SII** (Israel)
- TIN** (Poland)
- SITAC, KIWA, SWEDCERT** (Sweden)
- IIP** (Italy)
- BNQ** (Canada)
- BRANZ** (New Zealand)
- CERTIF** (Portugal)

Material:

The hygienic suitability of the material used for the aquatherm green pipe system is independently verified through test certificates from the Hygienic Institute in Gelsenkirchen. The suitability for potable water pipes in the field of cold and hot water is confirmed by current tests.

Processing:

The joining method requires no additives such as fluxes or solder. The connection is made by socket fusion.

Potable water – our most precious commodity good:

The increasing use of PP in the field of foodpacking confirms the hygienic qualities of the material. This makes aquatherm green pipe the optimal packing for our most precious commodity goods – potable water.

SOUND INSULATION

The sound insulation qualities of the PP-R-pipe system, related to water flow and hydraulic shock within a building, provide a sound proofing effect on noise transmission. Therefore the sound transmission is much lower compared to metallic pipes.

AQUATHERM & ECOLOGY

Environmental protection is very important to aquatherm.

Products, such as the aquatherm green pipe system are characterized not only by their long service life, but also by their excellent environmental compatibility. Since its foundation, aquatherm attaches great importance to the fact that its products and manufacturing processes do not pollute our sensitive ecosystems. Through the development of fully recyclable materials, it is possible that these can easily be fed into new productions.

Long before environmental protection was recognised as a global issue aquatherm fulfilled ecological standards which are demanded today. For now 40 years aquatherm has underlined its philosophy that ecological and economic interests are not contradictory, neither during production and sales, nor in the product application.

The environmentally friendly raw material fusiolen® is used for the manufacture of the aquatherm pipe systems. To ensure its environmental compatibility the basic material polypropylene, as well as all contained additives (colour pigments and stabilizers) were extensively tested, not only by aquatherm's own laboratory, but also by independent laboratories. Their results show that the material fusiolen® and the pipe systems from which it is manufactured, comply with the highest ecological standards and are thus future-oriented.

TECHNICAL DATA SHEET

Technical properties	fusiolen PP-R (80)	fusiolen PP-R (80) faserpipe
Melt-flow index 190°C/5 kg	0.5 g/10 min.	0.5 g/10 min.
Melt-flow index 230°C/2.16 kg	0.3 g/10 min.	0.3 g/10 min.
Modulus of elasticity	800 N/mm ²	1200 N/mm ²
Yield stress	25 N/mm ²	30 N/mm ²
Density	0.9 g/cm ³	1.0 g/cm ³
Tensile strength	25 MPa	35 MPa
Inflammation temperature	430 °C – 450 °C	490 °C – 500 °C
Thermal expansion coefficient	1.5 *10 ⁻⁴ K ⁻¹	0.35 *10 ⁻⁴ K ⁻¹
Coefficient of thermal conduction	0,15 W/mK (measured at pipe)	0,15 W/mK (measured at pipe)
Coefficient of friction in pipes	0.007	0.007
Bending radius	6 x d	
Water absorption	< 0.02 %	< 0.02 %
Electrical properties	fusiolen PP-R (80)	fusiolen PP-R (80) Faser
Relative permittivity	2,3 (in case of 1 MHz)	2,3 (in case of 1 MHz)
Puncture voltage	500 kV/cm	500 kV/cm
Specific resistance	> 10 ¹⁷ Ω cm	> 10 ¹⁷ Ω cm
Surface resistance	10 ¹⁴ Ω	10 ¹⁴ Ω
Dissipation coefficient	0.0002 (in case of 50 Hertz)	0.0002 (in case of 50 Hertz)

ENVIRONMENTAL PRODUCT DECLARATION AND LEED CERTIFICATION

As the world’s first pipe system manufacturer, aquatherm has developed an Environmental Product Declaration (EPD) for its products. Thus the aquatherm products contribute to the attainment of points in the LEED system. Learn more about the importance of life cycle assessments, environmental product declarations and LEED for planners, engineers and builders.

Life-Cycle Assessments (LCAs)

LCAs provide a comprehensive evaluation of the upstream and downstream energy and environmental impacts associated with a product. They are comprised of five parts: Goal, Scope, Life-Cycle Inventory Analysis, Results, and Interpretation. aquatherm has chosen the cradle-to-gate approach for its LCA „Life Cycle of Polypropylene Pressure Piping Systems“ encompassing the product life cycle from the extraction of raw materials through manufacturing and product distribution.

Environmental Product Declarations (EPDs)

The EPD is the document used to convey the LCA’s results to the products’ users and specifiers. It focuses on information about a product’s environmental impact such as global warming, ozone depletion, water pollution, ozone creation, and greenhouse gas emissions.

EPDs typically are verified following the processes described in ISO 14025, EN 15804, and ISO 21930 for construction products. These steps include: 1) Finding or developing a Product Category Rule (PCR); 2) Generating the input data and performing an LCA according to a specific PCR; 3) Compiling information in the EPD; 4) Verification of the EPD and LCA; and 5) Registration and publication.

aquatherm utilized ThinkStep as independent third party to conduct an ISO-conformant LCA for its following product lines: green pipe, blue pipe, lilac pipe, red pipe and the black system for radiant heating and cooling, and red pipe. In the study, one meter (3.2 ft) length of pipe was selected as functional unit per the requirements of the respective PCR “Piping Systems for Use for Sewage and Storm Water (Under Gravity)”. The declared product was defined as a representative average of the five aquatherm product offerings.

Two different test methodologies were chosen to analyze the products in the LCA: Tool for Reduction and Assessment of Chemical and Other Environmental Impacts (TRACI) 2.1 and CML 2001, a method developed by the Institute of Environmental Sciences at the University of Leiden in the Netherlands. The TRACI 2.1 method utilized impact categories, including Global Warming Potential (GWP), Acidification Potential (AP), Eutrophication Potential (EP), Ozone Depletion Potential (ODP), and Smog Formation Potential (SFP). The results of the findings are summarized in the following table.

Environmental impacts and Primary Energy Demand of aquatherm PP-R piping systems according to TRACI 2.1

Upon completion of the aquatherm product-specific LCA, aquatherm submitted its products, the LCA, and supporting documentation for independent verification by NSF International. The verification process included a review by an independent panel of experts, an audit of the manufacturing facilities and records, and a confirmation of material formulations. aquatherm’s Product-Specific Type III third-party verified EPD was published Dec. 18, 2015: <http://info.nsf.org/Certified/Sustain/ProdCert/EPD10069.pdf>

Within the EPD, you will find information on aquatherm, its product descriptions, data quality requirements, raw-materials origins, a manufacturing diagram, a declaration of parameters per the PCR, and the lifecycle-impact conclusion for aquatherm pipe.

Advantages of PP-R piping systems and radiant panels compared to metal systems

The analysis has shown that polypropylene comprises nearly 50% or more of the impact contribution depending on the impact category. Also Primary Energy Demand (PED) is mainly driven by polypropylene. However, this is because of the embodied energy content of the resin rather than fuel consumption upstream. In other words, aquatherm polypropylene has available energy within the material that can be recovered later in the product’s life cycle during recycling. This differs greatly compared with metals. With metal systems, all of the energy is used in the original processing of the raw material. Metals do not provide energy to the recycling process.

Thus aquatherm PP-R piping systems and radiant panels can provide a more sustainable, lower environmental impact option to designers, engineers, and building owners when compared with other piping and radiant panel systems.

How is aquatherm’s EPD relevant to LEED v4 points?

LEED stands for „Leadership in Energy and Environmental Design“ and is one of the most popular green building certification programs used worldwide. It was developed by the U.S. Green Building Council (USGBC) in 1998 and has defined various standards for environmentally friendly, resource-saving and sustainable construction.

LEED v4 incorporates point structures to encourage the use of products/ materials that environmentally, economically, and socially support preferable life-cycle impacts. Point structures were developed to reward the selection of products from manufacturers who have verified improved environmental life-cycle impacts.

aquatherm’s green pipe, blue pipe, lilac pipe, red pipe and black system products have attained Type III EPD status through independent verification by NSF International. They now can be utilized as a portion of the 20 permanent products engineers must have throughout their LEED-certified buildings. aquatherm’s EPD also carries double the weight of the Industry-Wide (Generic) EPD in terms of LEED product value and four times the weight of a self-certified Product-Specific Declaration by a manufacturer.

aquatherm has continued its industry leadership position by becoming the first piping manufacturer to have an independently verified, Product-Specific Type III EPD and by supporting building owner to achieve LEED certification.

For further information please see our White Paper: http://www.aquatherm-pipesystems.com/fileadmin/template/img/4.%20Service/PDF/aquatherm_LEEDv4_english.pdf

FIRE PROTECTION

The aquatherm PP-R-pipe systems comply with the requirements of the fire classification B2 DIN 4102 (normal inflammable). Compared to natural products like wood, cork or wool, aquatherm PP-R-pipes do not produce any gas toxicity. In case of fire, there is no risk of dioxin emissions.

To avoid fire and smoke transmission aquatherm advises the use of fire retardant seals. The fire resistance period is the minimum period in minutes.

The extent of the preventive measures depends on the type of installation. The determining of fire areas and fire classification has to be made in accordance with the law of the country. Information is given by the Planning Department and Building Control Office or the Fire Protection Representative.

Basically fire walls and ceilings with pipe passages have to be installed to the same fire resistance classification. All fire protection systems with a corresponding classification are suitable for aquatherm PP-R pipes.

The following companies offer suitable fire protection solutions:

Fire protection pipe shell Conlit 150 U:

DEUTSCHE ROCKWOOL GmbH & Co. KG

Notes/special installation conditions

- ¹⁾ In some cases, the available minimum insulation thickness is specified.
- ²⁾ For further insulation, the insulation ROCKWOOL 800 or TECLIT PS Cold can be used.
- ³⁾ For cold pipes, a vapor barrier must be available according to DIN 1988-200, therefore only use fire protection pipe shell Conclit 150U/ Insulating shell ROCKWOOL 800 or TECLIT PS Cold.
- ⁴⁾ Insulation thickness according to EnEV 50% and according to DIN 1988 - 200 suitable for the core bore diameter DK.

All basic conditions of the specified general building inspectorate test certificates must be considered.

FIRE LOAD

The values required for determining the fire load within a fire section are calculated from the total of all flammable materials located within this area. The calculation for establishing the combustion heat V [kWh/m] for a fire section in the event of an outbreak is dependent on dimensions and materials.

The basis used for the calculation of pipes made of PP-R is the lower calorific value

$H_u = 12.2$ kWh/kg (as per DIN V 18230 T1) in conjunction with the mass of material m_{pipe} [kg/m].

The integrated layers of faser in aquatherm faser-composite pipes also are considered.

Depending on the calculation procedure, the fire load is worked out with reference to the burn-up factor. This value is designated as m_{factor} and is taken as 0.8 for polypropylene.

Fire protection for aquatherm PP-R-pipes

The latest pipe supply regulation draft determines the professional wall and ceiling duct and also the pipe insulation of escape and rescue routes. The required pipe-insulation stipulated in this draft can be easily achieved by the aquatherm PP-R-pipes.

Combustion values V [kWh/m] for aquatherm green pipe, aquatherm blue pipe and aquatherm lilac pipe

UV-RESISTANCE

Pipes made from fusiolen® PP-R and fusiolen® PP-R C are normally not installed where subject to UV-radiation. All aquatherm PP-R-pipes and -fittings have UV-stabilizer to bridge transport and installation times. Maximum storage time in the open air is 6 months.

For the application in open air aquatherm offers composite pipes with UV-protective layer made from polyethylene, which excludes damages caused by sunlight.

aquatherm PP-R-pipes with UV-protection are always available in stock.

Available types of pipe:

- aquatherm green pipe MF**
- aquatherm blue pipe MF**

UV ADHESIVE TAPE

As an alternative to our pipes, factory-equipped with UV protective layer, the wrapping with UV tape is possible, e.g. when fittings or short pieces of pipe must be protected. Therefore an elastic tape with good resistance to abrasion, moisture, oils, mild acids and alkalis and outdoor weather influences should be selected. The tape should always be applied to a dry, clean and grease-free surface. The winding should be performed with slight pulling and at least 50 % overlap.

Further information on page 120.

CHEMICAL AND THERMAL DISINFECTION

of aquatherm drinking water systems made of polypropylene

a) Chemical disinfection of the system

Contrary to the disinfection of drinking water, the disinfection of a system is a discontinuous measure, comprising a drinking water system from the area of contamination to the tapping point of the consumer. In general, a disinfection is to be applied temporarily only in case of a proven contamination.

In case of **discontinuous** disinfections, it is allowed to load aquatherm pipes and the corresponding fittings twice a year with a content of free chlorine of 50 mg/l for not more than 12 hours.

Alternatively, 150 mg/l hydrogen peroxide (H₂O₂) can be used for 24 hours. A temperature of 30 °C must not be exceeded during the disinfection process. The use of a disinfection process, especially with chlorinated waters can have a direct influence on the lifetime of the drinking water system. Under no circumstances should chlorine dioxide be used.

b) Chemical disinfection of drinking water

In case of **continuous** disinfection with chlorinated drinking water, it can be used with a content of free chlorine of up to 0.3 mg/l (limit according to 2001 drinking water ordinance). The maximum temperature of 70 °C should not be exceeded.

Unless required by local regulations, residual disinfection is not necessary where there is no evidence of bacterial water contamination.

Under no circumstances should chlorine dioxide be used.

Recommendation of the World Health Organization – Guidelines for Drinking-water Quality, Fourth Edition

For effective disinfection, there should be a residual concentration of free chlorine of ≥ 0.5 mg/l after at least 30 min contact time at pH < 8.0. A chlorine residual should be maintained throughout the distribution system. At the point of delivery, the minimum residual concentration of free chlorine should be 0.2 mg/l.

c) Thermal disinfection of the system

In general, a thermal disinfection according to DVGW W551 is possible. In case of the thermal disinfection for the prevention of legionella bacteria according to DVGW worksheet W 551, the water temperature will be adjusted in such a way that it amounts to 70 °C for at least 3 minutes at all points of the drinking water system. The maximum admissible limits of use regarding the service temperature and pressure are to be observed.

INTEGRATION OF OTHER SYSTEMS OR COMPONENTS WITH AQUATHERM PIPING FOR PRESSURE PIPE APPLICATIONS

When integrating aquatherm piping systems with other systems or components not made of PP-R (e.g. components not made of PP-R like valves, pumps, other piping, check valves, strainers, etc), care must be taken to ensure the operating parameters for PP-R won't damage the other materials or vice versa.

Be aware that even if the aquatherm pipe is compatible with the fluid being transported, other materials in the system may not be. All parts of the system must be verified as compatible with the medium being carried before installing them. And, while aquatherm pipe does not require treatment to protect it from corrosion, metals (ferrous and non-ferrous) in the system may be susceptible to corrosion.

Do not mix aquatherm pipe with other piping systems in conditions that will cause the other system or components to fail.

DOMESTIC HOT WATER RECIRCULATION (DHWR)

A hot water circulation system includes all components that are in contact with the circulating water, including the flow and return supply. When there is copper piping used in conjunction with PP-R in a DHWR system, care should be taken to ensure the operating conditions will not cause degradation or erosion/corrosion of the copper. aquatherm recommends following the Copper Development Association guidelines (CDA Publication A4015-14/16: The Copper Tube Handbook – www.copper.org) for sizing, temperature and flow velocity in copper tubing. This will also help ensure that the copper levels in the water do not approach the regulatory action levels recommended by independent institutions (e.g. U.S. Environmental Protection Agency (EPA), World Health Organization (WHO), Federal Ministry of Justice and Consumer Protection of Germany). Sustained high levels of copper in DHWR piping can damage components within the system, even PP-R. **Damage caused by copper in the water resulting from erosion/corrosion or other degradation of copper components in the DHWR system will void the aquatherm warranty.**

Accordingly, and as mandated by various regulations and codes in DHWR systems, it is considered good design and operational practice to ensure that the maximum HW-temperature within any part of the system / loop does not exceed 60 °C (140 °F). Some regulations and codes further restrict the temperature at any fixture to a maximum of 50 °C (120 °F). There are some exceptions to this such as the process of thermal disinfection in health care facilities where temperatures of 70 °C (160 °F) or higher can be applied for short periods of time throughout the pipe system.

Importantly, the maximum temperature used must not exceed the rating of the pipe for the operating pressure. (See aquatherm green pipe catalogue – table: permissible working pressure potable/drinking water – Fluid transported: water acc. to DIN 2000)

According to some regulations and codes, flow rates in a DHWR system should not exceed 0.5 m/s (1.5 ft/sec) anywhere in the system, except in some special cases where velocities up to 1 m/s (3 ft/sec) are needed to achieve proper flow temperature. The CDA Publication A4015-14/16 – The Copper Tube Handbook – limits the velocity in DHWR system to similar rates.

When re-piping an existing DHWR-system originally installed in copper tubing, ensure all possible copper is replaced. If some copper remains as part of the system, strictly follow the rules and guidelines of the Copper Development Association (CDA Publication A4015-14/16: The Copper Tube Handbook) regarding flow rates and water conditions. Small amounts of copper or brass in valves and other equipment will generally not cause an issue. If the copper fails, it may degrade o-rings, gaskets, PP-R and other components as well, shortening their service life.

When adding PP-R to an existing copper system in a DHWR-application, the level of copper in the water should be tested. These levels should not exceed

0.1 mg/L (ppm). Higher levels of total copper indicate that the copper pipe is corroding/eroding due to system and/or water conditions.

To hydraulically balance a DHWR-system and ensure the required flow rate for each area of the building, it is necessary to install hydraulic-balancing-valves in every circulating loop throughout the complete system. This also maintains the flow velocity in the smaller return piping at or below the manufacturer's or CDA's recommendations.

In addition to sizing the piping and pumps to the correct flow velocity, care must also be taken to avoid water hammer and excessive surge pressures. Pump systems operating with on/off cycling, or pumps over-sized for the piping, can create high pressure and fatigue the piping material. The pump total dynamic head (TDH) must also be matched to the flow requirements, piping layout, and operating conditions to avoid cavitation for all components throughout the system. Cavitation can lead to excessive system noise and more importantly, can result in the erosion and degradation of the pipe surface and other components. Properly sized variable-speed (VFD) constant pressure pumping systems and pressure-sustaining valves can alleviate these issues. The pumps should be sized to operate at maximum efficiency with the lowest energy usage for the required flow rate.

The issues described here are only of concern in DHWR-systems. For domestic cold water (DCW) and mechanical (heating-cooling)-systems no additional requirements or actions are necessary. In some situations, the DHWR system is also used to provide hot water to the mechanical heating system. Additional consideration and care must be given for this type of combined system, as the mechanical components may not be compatible with the more aggressive water conditions and flow velocity limitations of DHWR systems, and these components may be not suitable for potable water contact.

QUALITY ASSURANCE

The following laws, decrees, guidelines and standards have to be considered on planning and designing aquatherm PP-R-pipes for potable water and heating installations:*

Planning:

TrinkwV-2000 Regulation for Potable Water

DIN 2000 Central drinking water supply-Guidelines regarding requirements for drinking water, planning, construction, operation and maintenance of plants

EnEV Decree for Energy Saving

DIN 1988 Standard for Potable Water Installations

ISO 10508 Plastic pipe systems for hot and cold water installation – Guideline for classification and dimensioning

All provided pipe-systems correspond to the technical conditions of the application classes acc. to ISO 10508 for the field of potable water and heating.

aquatherm green pipe for the classes 1, 2 (potable water), aquatherm blue pipe for the classes 4 and 5 (heating). For the application of the classification system (acc. to ISO 10508) the national regulations and the manufacturer's instructions must be considered.

DIN 4109 Standard for the Elimination of Noise in the Field of Structural Engineering

DIN 18381 Installation of Gas, Water and VOB Part C Sewage Pipes inside Buildings

DIN 16928 Pipe Connections, Fittings, Installation

DVS 2207 Welding of Thermoplastics

DVS 2208 Welding Machines and Devices for Thermoplastics

BS 6920

“Suitability of non-metallic products for use in contact with water intended for human consumption with regard to their effect on the quality of water.”

Local regulations and codes of practice must be observed. The same goes for regulations regarding the use of chemicals.

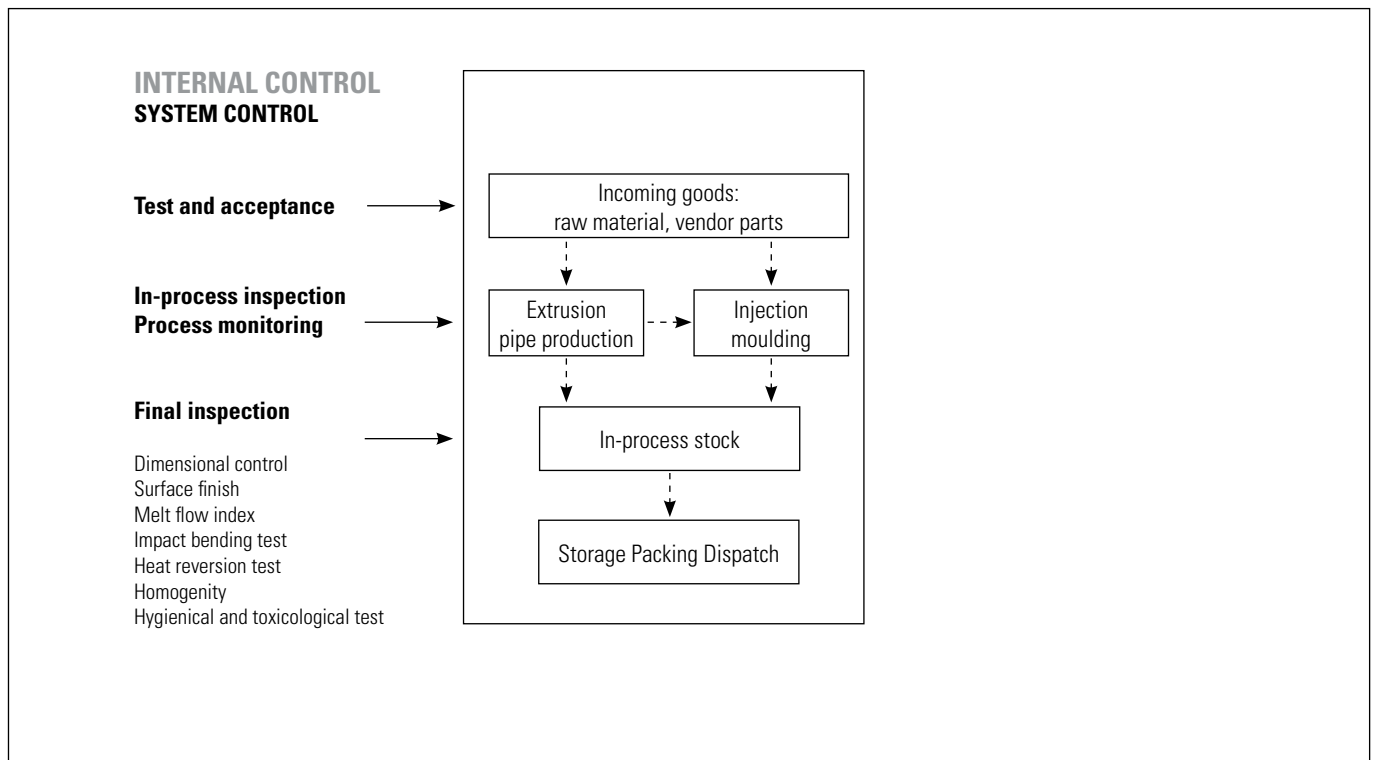

*(Additional regional decrees and recommendations are disregarded.)

COMPLIANCE WITH THE SYSTEM STANDARD

Various national and international independent authorities and institutions confirm aquatherm's quality standard

AQUATHERM QUALITY MANAGEMENT SYSTEM

In addition to the permanent internal quality control, an external control is made by i.e. SKZ, SAI, TGM, Hygieneinstitut.

SYSTEM CONTROL

The production of a quality controlled pipe system demands the supervision, regulation and control of all work operations. All results and processes have to be documented.

This requires

- Test and acceptance of incoming goods
- Process control
- In-process inspection and test
- Final inspection and test

Relevant regulations for the quality control of potable water pipe systems are:

- DIN-guidelines
- DVGW-working sheets
- Supervisory Regulations of the SKZ (Süddeutsches Kunststoff-Zentrum)

These standards and guidelines detail the minimum requirements for internal control.

Conformance to the standards is verified by independent institutes in form of internal audits and laboratory tests.

aquatherm has many years of experience in extrusion and injection moulding and is the market leader and pioneer in the manufacture of polypropylene pipe systems.

This experience is reflected in internal quality standards and laid down procedures, which are taken strongest note of and are documented by the constant quality of our products.

Internal control

Trained and qualified employees and a modern equipped laboratory ensure that all tests are carried out and regulations are complied with in accordance with the quality control policy, which includes

- Control of inspection, measuring and test equipment process and Production control
- Receiving inspection test
- In-process inspection
- Final inspection

All internal quality controls are documented and recorded in accordance with the quality control policy.

QUALITY ASSURANCE

Test and acceptance of incoming goods

All incoming goods are subject to a test. This ensures that incoming products conform to specified requirements. Goods, which have not been tested are not released for production.

In-process inspection and test

The quality plan requires that tests and inspections are carried out before and during production. At the start of production all quality relevant data are checked by the quality assurance department. Preproduction samples are tested by the laboratory technicians for

- Surface finish
- Dimensional accuracy of the test samples
- Data from extrusion and injection moulding machines

and whether they meet the specifications. Only if this is ensured, it will be released for production. The tests are carried out at the beginning of each series production in order to guarantee impeccable quality.

Process control

Ultrasonic measurement and process data recording in the field of extrusion are only two examples of the extensive quality control process.

This equipment enables constant observation and control of production.

Ultrasonics automatically measure and report any deviations in tolerance to the cutting device on the extrusion machine so that the sizing plant automatically isolates a substandard product. This ensures that only perfect quality products are packed and stored.

All data received during production is analyzed in detail.

Final inspection and test

After completion of the products, all final inspections specified in the test plan are conducted. Only if it has been proven that all the required tests are fully documented and the results correspond to the optimum system quality, the products are sent to the finished goods warehouse.

The final inspection and test covers the following test procedures:

- Dimensional control
- Surface finish
- Measurement of the melt flow index
- Impact bending test
- Heat reversion test
- Homogeneity of the material
- Internal pressure test

In addition to the tests mentioned above, daily hygiene tests in accordance with KTW/DVGW Guidelines are carried out regularly in the company's own sensory analysis laboratory.

EXTERNAL CONTROL

External supervision consists of tests of a defined scope and in defined intervals. The respective supervising institutions appoint authorized test organizations to carry out these tests.

The external supervision includes external tests of the products and

- a) internal audit of aquatherm's quality assurance system and test procedures,
- b) calibration of the test equipment and
- c) hygienic and toxicity tests.

The results of the supervisory visits as well as external tests made on pipe and fitting samples are confirmed to aquatherm in test certificates.

In Germany, the external supervision of the aquatherm green pipe system is carried out by the

- SKZ (Süddeutsches Kunststoffzentrum in Würzburg)
- Institute for Hygiene, Gelsenkirchen (Hygieneinstitut in Gelsenkirchen)

who are authorized by the DVGW (German Institute for Gas and Water) as controlling organization. The external supervision for certificates from abroad is carried out in a similar way.

Storage / packing / dispatch

Upon successful release the products are stored in suitable warehouses.

Internal instructions control the method of packing, storage and dispatch of the products. The warehouse staff is responsible for control of the stored product.

FUSION

PART A: ASSEMBLY OF WELDING TOOLS

The professional processing of aquatherm PP-R-medium pipes is made by the following tools for the connection of insulated pipes and fittings by socket welding or by butt-welding.

IMPORTANT!

Only use the original aquatherm welding devices and aquatherm welding tools, except devices and tools which are especially approved by aquatherm.

1. **aquatherm** manual welding device (800 W) without welding tools (Art. no. 50337) for medium pipes of dimension 16–63 mm
2. **aquatherm** manual welding device (1400W) without welding tools (Art. no. 50341) for medium pipes of dimension 50–125 mm
3. **aquatherm** welding tools for manual welding devices

Art. no. 50206	16 mm
Art. no. 50208	20 mm
Art. no. 50210	25 mm
Art. no. 50212	32 mm
Art. no. 50214	40 mm
Art. no. 50216	50 mm
Art. no. 50218	63 mm
Art. no. 50220	75 mm
Art. no. 50222	90 mm
Art. no. 50224	110 mm
Art. no. 50226	125 mm

4. **aquatherm** welding machine (1400W) incl. welding tools 50–125 mm (Art. no. 50148) for medium pipes of dimension 50–125 mm
5. **aquatherm** butt-welding-machines for medium pipes of dimension 160–630 mm
6. **aquatherm** electrical welding jig Art. no. 50159 for medium pipes of dimension 63–125 mm

Manual welding device 800W with welding tools 16–63 mm

Manual welding device 1400W with welding tools 50–125 mm

Welding machine

Butt-welding machine two-ring-machine and accessories

Electrical welding jig

MOUNTING OF THE TOOLS

1. aquatherm green, blue and lilac pipe system are processed identically.

Assemble and tighten the cold welding tools manually.

3. Before fusing the distribution block, in which two connections are fused simultaneously, the welding tools have to be placed into the respective holes as described in the adjoining table A and drawing B.

4. All welding tools must be free from impurities. Check if they are clean before assembling. If necessary clean the welding tools with a non fibrous, coarse tissue and with methylated spirit.

Place the welding tools on the welding device so that there is full surface contact between the welding tool and the heating plate. Welding tools over Ø 40 mm must always be fitted to the rear position of the heating plate.

Electric supply:

The power supply must coincide with the data on the type plate of the welding device and must be protected according to the local regulations. To avoid high power loss, the conductor cross-section of the used extension cables must be selected according to the power input of the welding devices.

6. Plug in the welding device. Depending on the ambient temperature it takes 10–30 minutes to heat up the heating plate.

A

Art. no.	Passage	Hole	Branch	Hole
30115	Ø 25 mm	A + E	Ø 20 mm	A + C
85123	Ø 20 mm	A + B	Ø 16 mm	A + C

B

PART A: HEATING UP PHASE / HANDLING

Temperature pilot lamp (yellow)
glows constantly while the heat-up phase and blinks, when the welding temperature is achieved

Operating lamp (green)
glows constantly, as soon as the device is connected with the power supply system

Part A: Heating up phase

- 7. During the heating up phase tighten the welding tools carefully with the Allan key.

Take care that the tools completely contact the heating plate. Never use pliers or any other unsuitable tools, as this will damage the coating of the welding tools.

- 8. The temperature of 260 °C is required for the welding of aquatherm PP-R-pipes.

Acc. to DVS-Welding Guidelines the temperature of the welding device has to be checked at its tool before starting the welding process.

This can be done with a fast indicating surface thermometer.

ATTENTION:

First welding – soonest 5 minutes after reaching of the welding temperature. DVS 2207, Part 11.

Part A: Handling

- 9. A tool change on a heated device requires another check of the welding temperature at the new tool (after its heating up).
- 10. If the device has been unplugged, e.g. during longer breaks, the heating up process, has to be restarted (see item 6).
- 11. After use unplug the welding device and let it cool down. Water must never be used to cool the welding device, as this would destroy the heating resistances.
- 12. Protect aquatherm welding devices and tools against impurities. Burnt particles may lead to an incorrect fusion. The tools may be cleaned with aquatherm cleaning cloths, Art. no.50193.

Always keep the welding tools dry.

- 13. After welding, do not lay the device on the Teflon coated tool, but put it down in the provided supporting stand.
- 14. For a perfect fusion, damaged or dirty welding tools must be replaced, as only impeccable tools guarantee a perfect connection.
- 15. Never attempt to open or repair a defective device. Return the defective device for repair.
- 16. Check the operating temperature of aquatherm welding devices regularly by means of suitable measuring instruments.

PART A: GUIDELINES

PART B: CHECKING OF DEVICES AND TOOLS

Part A: Guidelines

17. For the correct handling of welding machines the following must be observed:

General Regulations for Protection of Labour and Prevention of Accidents and particularly the Regulations of the Employers' Liability Insurance Association of the Chemical Industry regarding Machines for the Processing of Plastics, chapter: „Welding Machines and Welding Equipment“.

18. For the handling of aquatherm welding machines, devices and tools please observe General Regulations DVS 2208 Part 1 of the German Association for Welding Engineering, Registered Society (Deutscher Verband für Schweißtechnik e.V.).

Part B: Checking of devices and tools

1. Check, if the aquatherm welding devices and tools comply with to the guidelines "Fusion Part A".

2. All used devices and tools must have reached the necessary operating temperature of 260 °C. This requires acc. to "Fusion Part A, item 8" a separate test, which is indispensable (DVS-Welding Guidelines):

Suitable measuring instruments have to measure a temperature of up to 350 °C with a high accuracy.

NOTE:

aquatherm recommends the original aquatherm temperature measuring device Art. no. 50188

PART B: PREPARATION FOR THE FUSION

3. Cut the pipe at right angles to the pipe axis. Only use aquatherm pipe cutters or other suitable cutting pliers. Take care that the pipe axis is free from burrs or cutting debris and remove where necessary.

4. Mark the welding depth at the end of the pipe with the enclosed pencil and template.

5. Mark the desired position of the fitting on the pipe and/or fitting. The markings on the fitting and the uninterrupted line on the pipe may be used as a guide.

Measurement of temperature at the aquatherm manual welding device (800W)

Measurement of temperature at the aquatherm welding machine

Measurement of temperature at the aquatherm butt-welding machine

Cutting of the pipe

Marking of the welding depth

PART B: HEATING OF PIPE AND FITTING

Heating of pipe and fitting

6. Push the end of the pipe, without turning, up to the marked welding depth into the welding tool.

It is essential to observe the aforementioned heating times.

Pipes and fittings of the dimensions \varnothing 75 to 125 mm can only be welded with welding device Art. no. 50341 (or with machine Art. no. 50148). On using the aquatherm welding machine Art. no. 50148 a separate operating instruction has to be observed.

ATTENTION:

The heating time starts, when pipe and fitting have been pushed to the correct welding depth on the welding tool. Not before!

PART B: SETTING AND ALIGNMENT

7. After the required heating time quickly remove pipe and fitting from the welding tools. Joint them immediately, and without turning, until the marked welding depth is covered by the PP-bead from the fitting.

ATTENTION:

Do not push the pipe too far into the fitting, as this would reduce the bore and in an extreme case will close the pipe.

8. The joint elements have to be fixed during the specified assembly time. Use this time to correct the connection. Correction is restricted to the alignment of pipe and fitting. Never turn the elements or align the connection after the processing time.
9. After the required cooling time the fused joint is ready for use.

The result of the fusion of pipe and fitting is a permanent material joining of the system elements. Connection technique with security for a life-time.

The fusion is subject to the following data

Pipe external- \varnothing	Welding depth	Heating time		Welding time	Cooling time
		sec. DVS	sec. AQT*		
mm	mm	sec.	sec.	sec.	min.
20	14,5	5	8	4	2
25	16,0	7	11	4	2
32	18,0	8	12	6	4
40	20,5	12	18	6	4
50	23,5	18	27	6	4
63	27,5	24	36	8	6
75	30,0	30	45	8	8
90	33,0	40	60	8	8
110	37,0	50	75	10	8
125	40,0	60	90	10	8

ATTENTION: sec. AQT* heating times recommended by aquatherm at ambient temperatures below + 5 °C

Heating-up of pipe and fitting

Joining, fixing and...

...aligning

The result: a permanent connection!

Dimension 160–630 mm:

The dimension 160–630 mm are joined by butt-welding.

Detailed information page 66–71.

The General Guidelines for Heated Tool Socket Welding acc. to DVS 2207 Part 11 are applied hereupon.

PART B: UNIVERSAL PEELING TOOLS

By using the aquatherm universal peeling tools the end pieces of the aquatherm OT (oxygen tight) and UV (UV-resistant) can be peeled. By the uniform removal of the outer layer of the pipe any extension of the pipe system by electrofusion socket or fitting is possible. The universal peeling tools are available in the sizes \varnothing 20–125 mm (Art. no. 50479–50488). The peeling process is done either mechanically or manually. For the mechanical processing two attachment plates for pipe sizes \varnothing 20–63 mm (Art. no. 50499) and \varnothing 75–125 mm (Art. no. 50500) are available. For the mechanical processing of the electrofusion sockets the peeler is extended by an attachment (Art. no. 50489–50498). The power drill should have a high torque.

1. INSTRUCTIONS FOR THE MECHANICAL PEELING PROCESS

1.1. The attachment plate is clamped with the hexagon bolt in the power drill.

1.2. The peeler is fixed with its screws in the slot matching the diameter of the attachment plate and rotated clockwise so that the peeler adheres to the attachment plate.

1.3. The peeling tool clamped on the chuck is set by the lead to the end of the pipe.

1.4. The peeling process starts with rotation of the peeling tool upon slight force in axial direction. The peeling operation is completed when the attachment plate strikes against the pipe end.

1.5. The pipe now can be welded by socket welding method.

2. INSTRUCTIONS FOR THE MECHANICAL PEELING PROCESS FOR ELECTROFUSION SOCKETS

2.1. The extension is centered with the peeler through the superimposed chamfer fit and fastened with three Allen screws.

2.2. The attachment plate is clamped with the hexagon bolt in the power drill and connected with the peeling tool (see photo **1.2.**).

2.3. The peeling process starts with rotation of the peeling tool upon slight force in axial direction. The peeling operation is completed when the carrier plate strikes against the pipe end.

2.4. The peeling tool is withdrawn from the pipe and the E-socket welding process can start.

3. PEELING INSTRUCTIONS FOR MANUAL PEELING

3.1. For the manual peeling two handles are mounted at the peeling tool.

3.2. The peeling tool is pushed onto the untreated pipe up to the stop.

3.3. The peeling tool is turned clockwise as long as the marked peeling depth (see table on the next page) is reached.

3.4. If the specified/marked peeling depth (see table) is reached, the peeling tool is removed and the socket welding process can start. If the electric socket can be used as a sliding sleeve, the peeling depth for the electric socket welding (see table) must be doubled.

**TABLE OF PEELING DEPTH:
SOCKET AND ELECTRIC SOCKET WELDING**

Diameter	Peeling depth Socket welding	Peeling depth Electric socket welding
ø 20	16 mm	39 mm
ø 25	20 mm	43 mm
ø 32	22 mm	45 mm
ø 40	25 mm	50 mm
ø 50	28 mm	56 mm

Diameter	Peeling depth Socket welding	Peeling depth Electric socket welding
ø 63	32 mm	65 mm
ø 75	34 mm	69 mm
ø 90	37 mm	77 mm
ø 110	42 mm	85 mm
ø 125	44 mm	90 mm

PART C: WELD-IN SADDLES

aquatherm weld-in saddles are available for pipe outer diameter of 40–630 mm.

Weld in saddles are used for

- Branch connections in existing installations
- The substitution of a reduction-tee
- Branch connections in risers
- Sensor wells, etc.

The maximum sensor well diameter is specified in the table on page 55.

1. Before starting the welding process, check whether the aquatherm welding devices and tools comply with the requirements of "Fusion Part A".

2. The first step is to drill through the pipe wall at the intended outlet point by using the aquatherm drill (Art. no. 50940–50958).

3. IMPORTANT!

Only the oxygen barrier layer of the aquatherm blue pipe OT Art. no. 2170708–2170138 must be removed with the mentioned aquatherm special peeling drills mentioned in the table beside.

For this the special peeling drill is inserted into the bore hole and swayed 2–3 times with light pressure and low rotating speed between the pipe walls until the oxygen barrier layer is completely peeled off.

The UV-layer is removed in the same way.

Remove burrs, debris and other dirt with a chamfering tool or the aquatherm cleaning wipes. Do not touch the peeled surface any more and protect it from new pollution.

4. The welding device/saddle welding tool must have reached the required operating temperature of 260 °C (check with reference to "Fusion Part B, item 2").

5. The welding surfaces have to be clean and dry.

6. Insert the heating tool on the concave side of the weld in saddle tool into the hole drilled in the pipe wall until the tool is completely in contact with the outer wall of the pipe. Next the weld-in saddle tool is inserted into the heating sleeve until the saddle surface is up against the convex side of the welding tool. The heating time of the elements is generally 30 seconds.

7. After the welding tool has been removed, the weld-in saddle tool is immediately inserted into the heated, drilled hole. Then the weld-in saddle should be pressed on the pipe for about 15 seconds. After being allowed to cool for 10 minutes the connection can be exposed to its full loading. The appropriate branch pipe is fitted into the sleeve on the aquatherm weld-in saddle using conventional fusion technology.

By fusing the weld-in saddle with the pipe outer surface and the pipe inner wall the connection reaches highest stability.

Drilling through the pipe wall

Removal of the oxygen barrier layer in case of the aquatherm blue pipe OT and of the UV layer in case of the aquatherm UV-pipe

¹ only for aquatherm blue pipe OT faser composite pipes, Art. no. 2170708-2170138

PART C: WELD-ON SADDLE

Drilling of aquatherm PP-pipes with the hot tapping tool Art. no. 50890 under pressure.

The aquatherm weld-on saddle set (consisting of ball valve, pipe and saddle in the dimensions 40 mm and 63 mm) is used for the additional installation of branch connections.

The PP-R pipes aquatherm green pipe, blue pipe and lilac pipe with the pipe structure S, MF and MF UV in the dimensions 75–630 mm can be drilled under pressure.

SAFETY INSTRUCCION::

The medium pressure (e.g. water) in the main pipe of 6 bar and the medium temperature of max. 60 °C must not be exceeded.

1. Preparation and fusion

After removal of the oxide layer on the main pipe and the cleaning of the welding surfaces, the welding device is placed with the weld-on saddle tool on the surfaces to be welded. Under gentle pressure and a warm-up time of 90 sec. an even bead must be there on the welding surfaces. After a warm-up time, the component is placed quickly on the main pipe. The component is fixed and aligned on the main pipe for max. 15 seconds. The connection is fully able to work under pressure after a cooling time of 15 minutes.

2. Assembly of the hot tapping tool

The hot tapping tool is screwed onto the component with the retracted drill rod, which is secured by the clamping claw. The screw connection on the ball valve is tightened by hand. After the ball valve has been opened, the welded component in conjunction with the hot tapping tool is tested for leaks with water or air.

3. Drilling process

When the clamping claw is loosened, the drill rod is pushed until the drilling tool contacts the pipe. Depending on the branch size, the appropriate feed rate must be set. The drilling is carried out by actuating the ratchet handle and simultaneously by giving a manually sensitive feed on the feed handles. After completion of the drilling and the release of the clamping claw, the drill rod is lead back to the stop by hand. Caution: The drill rod can rebound by the pressure in the pipe. The ball valve is then closed and the hot tapping device is relieved of pressure.

4. Disassembly

Detach the hot tapping device by holding the screw on the ball valve and remove it from the component. Pull the drill rod out of the hot tapping device and screw the drilling tool from the drill rod using a suitable wrench or armature tongs.

Hot tapping device Art.no. 50890

1. Welding-on of weld-on saddle set onto the main pipe

2. Assembly of the hot tapping tool onto the component

3. Start of the drilling process

4. Removal of the drilling residues out of the drilling tool

PART D: PULLING JIG (HITCH)

Notice

The following description of the electric pulling jig applies to the type of the year 2013.

Operation and fusion

With the help of the electric pulling jig, all aquatherm PP-R-pipes and fittings in dimensions from 63 to 125 mm are in a very simple manner without any effort welded together.

Also the pulling jig simplifies the welding of pipes and fittings under ceilings, in narrow shafts and other hard-to-reach places.

1. Preparation for the fusion

Mark the welding depth with the included green marking template on the pipe end (Fig. 1). In addition, the clamping depth is measured 2 cm from the welding depth marking and marked again (Fig. 2 + 3).

PART D: PULLING JIG (HITCH)

1. Preparation for the fusion

The pulling jig is now placed on the fitting or pipe to be welded with the clamping jaws (Fig. 4).

The two arrows of the jaws and the machine must be flush with each other. The jaws are to be fixed with the help of the clamping device (Fig. 5).

Align the pipe so that the rear marking is flush with the inner edge of the clamping jaw. The front marking identifies the welding depth (Fig. 6).

Lock pipe and fitting by using the front adjusting screws (Fig. 7).

Never clamp so tight that deformations appear. Additionally, with the fitting support, all fittings are supported. The support is mounted on the clamping jaw for fittings (Fig. 8).

PART D: PULLING JIG (HITCH)

2. Fusion

Hold the welding device between pipe and fitting and ride machine carriage in batches together (pay attention to the welding depth).

Basically the jaws must be released after the insertion of pipe and fitting in the welding tool by a short return of the machine (3–7 mm)! The jaws must always be parallel to each other (Fig. 9 +10).

After finishing of the warm-up drive the machine carriage apart and remove the welding device (Fig. 11).

Ride the jaws together again and release the clamping jaws again by a short return of the machine (3–7 mm) (Fig. 12).

CAUTION:

Jaws may be released only after the expiry of the cooling time!

Pipe and fitting are now joined by fusion to a material unit (Fig. 13).

The fusion is subject to the following data

Pipe external- Ø	Welding depth	Heating time		Welding time	Cooling time
		sec. DVS	sec. AQT*		
mm	mm	sec.	sec.	sec.	min.
63	27,5	24	36	8	6
75	30,0	30	45	8	8
90	33,0	40	60	8	8
110	37,0	50	75	10	8
125	40,0	60	90	10	8

ATTENTION: sec. AQT* heating times recommended by aquatherm at ambient temperatures below + 5 °C

The General Guidelines for Heated Socket Welding acc. to DVS 2207, Part 11 are applied hereupon.

PART E: AQUATHERM WELDING MACHINE

for stationary processing 50–125 mm

precise pre-assembly and facilitation by hand creek

clamping jaws 50–125 mm, tools 50–125 mm

Scope of supply:

wooden transport box, slide with sub construction, clamping jaws 50–125 mm, welding tools 50–125 mm, stay with rolls

For welding of aquatherm green pipe/aquatherm blue pipe/aquatherm lilac pipe a welding temperature of 260 °C at the welding tools is necessary (see page 49).

Instructions for use can be taken from the attached operation manual.

The fusion is subject to the following data

Pipe external- Ø	Welding depth	Heating time		Welding time	Cooling time
		sec. DVS	sec. AQT*		
mm	mm	sec.	sec.	sec.	min.
50	23,5	18	27	6	4
63	27,5	24	36	8	6
75	30,0	30	45	8	8
90	33,0	40	60	8	8
110	37,0	50	75	10	8
125	40,0	60	90	10	8

ATTENTION: sec. AQT* heating times recommended by aquatherm at ambient temperatures below + 5 °C

The General Guidelines for Heated Socket Welding acc. to DVS 2207, Part 11 are applied hereupon.

Dimension 160–630 mm:

The dimension 160–630 mm are joined by butt-welding.

Detailed information on page 66–71.

PART E: WELDING MACHINE PRISMA-LIGHT

Welding machine prisma-light with heating plate without tools

Clamping fixture for fixing the prisma-light e. g. at the work bench

1. Check machine: temperature lamp blinks after reaching the welding temperature (260 °C), adjust clamping jaws 63–125 mm coarsely. Mark welding depth with the template at the pipe.
2. Fix the fitting against the clamping jaws.
3. Place the pipe loose in the opposite clamping jaws.
4. Position the welding device centrally to the pipe-fitting axis and remove it.
5. Lock the front calibration knob and drive up the slide as far as it will go.
6. In this position push the pipe against the fitting and fix it with the clamping jaws.
7. Regulate the welding time according to the table on page 59, place the welding device and push the fitting and pipe slowly as far as it will go up to the marking.
8. The heating time starts when pipe and fitting are completely pushed on the tool. When heating time is complete slide return the slide, remove the heating device quickly and join the pipe and fitting.
9. Consider cooling times from the table on page 59.

More detailed information can be taken from the enclosed operating manuals.

PART F: ELECTROFUSION DEVICE

Fusion

The aquatherm electrofusion device was specially developed for electrofusion sockets from Ø 20–250 mm.

The fusion of 160–250 mm aquatherm blue pipe MF OT with the electrofusion socket is not possible.

Technical information:

supply voltage: 230 V (nominal voltage)
 nominal capacity: 2.800 VA, 80 % ED
 rated frequency: 50–60 Hz
 protection class: IP 54

1. General and inspection

Cleanliness is – besides correct workmanship – the most important precondition for a correct fusion. For keeping the sockets clean do not unwrap them before processing.

The pipe surface must also be clean and undamaged. Deformed pipe ends must be cut off.

All parts of the system to be fused as well the temperature sensors shall have the same temperature (e.g. sun radiation or unadapted storing may cause differences in temperature!) within the acceptable range of temperature (e.g. +5 °C to 40 °C according to DVS 2207).

2. Preparation

Follow carefully the order of working steps!

Preparation is one of the most important steps of the electrofusion process!

- a. Cut the ends of the pipes rectangularly and deburr them thoroughly
- b. Clean and dry the ends of the pipes at the necessary length
- c. Mark the depth of aquatherm electro-fusion-socket on the end of the pipe

aquatherm electrofusion device Ø 20–250 mm

aquatherm electrofusion socket

aquatherm peeling tool (Art. no. 50558–50572, up to 90 mm)
 (from 110–250 mm: Art. no. 50574–50592 (without picture))

Welding depth up to 250 mm													
Ø	20	25	32	40	50	63	75	90	110	125	160	200	250
ET	35,0	39,0	40,0	46,0	51,0	59,0	65,0	72,5	80,0	86,0	93,0	105,0	125,0

TEIL F: ELECTROFUSION DEVICE

Fusion

- d. Peel the surface of both pipes up to the marks thoroughly with a peeling tool (use the aquatherm peeling tool with the respective pipe diameter)

IMPORTANT!

Before the fusion peel off the oxygen barrier layer of the aquatherm blue pipe OT and the UV-layer of the faser composite pipe UV completely to the stop by using the universal peeling tools considering the pipe diameter.

By turning the adjusting screw clockwise to the stop, the peeling tools can be adjusted into small depths (sockets), by turning them counter clockwise up to the stop they can be adjusted into big peeling depth (electrofusion sockets).

e. Clean again thoroughly

Without complete peeling of the fusion surface a homogeneous and tight welding connection is not assured. Damages of the surface like axial grooves and scratches are not accepted in the fusion zone. Never touch peeled surfaces and protect them against dirt and grease. Start the fusion process within 30 mins after peeling.

3. Assembling the electrofusion sockets

Avoid soiling and fix all parts securely!

1. Open the protective wrapping of the aquatherm electrofusion sockets (cut with knife along the edge of the bore), leaving the rest of the foil intact. Clean the inside of the fitting carefully with aquatherm cleaning wipes. Assemble the fitting within 30 mins after opening of the protective foil.
2. Push the aquatherm electrofusion sockets on the clean and dry end of the pipe (up to the marked depth). Use pressing clamps if necessary.

Cut the pipes to be welded, peel, clean and dry thoroughly with a lint-free cloth or paper

Clean the electrofusion socket's inner surface with a lint-free cloth or paper. Remove moisture that may occur **immediately before the welding process** again.

Push the electrofusion socket onto the pipe end

PART F: ELECTROFUSION DEVICE

Remove the protective foil completely and push the other prepared pipe end into the aquatherm electro-fusion sockets tighten in the fixation.

Leave the pipes, free from bending stress or own weight, within the aquatherm electrofusion socket. The socket is movable at both pipe ends after assembling. The air gap has to be even around the circumference. Pipes and fittings must be welded stress-free.

4. Fusion process

1. Position the fitting with even air gap around the circumference.
2. Regulate fusion equipment for the right fusion parameter.
3. Compare the indications of the fusion equipment with the parameters of the label.
4. Start and watch the fusion process.

Do not move or stress pipe and fitting during the whole fusion process and cooling time.

5. Cooling time and pressure test

A fused pipe-joint shall not be moved (no release of the fixation) or stressed before complete cooling.

The minimum required cooling time is marked on each aquatherm electrofusion socket. Ambient temperatures of more than 25 °C or strong sun-radiation need longer cooling times.

Working pressure

The operation pressure can be taken from the imprint on the electric welding socket. The relation between working temperature, pressure load and service life is given in the tables "Permissible working pressure."

For further information concerning electrofusion socket and details about the aquatherm electrofusion device read the enclosed operating instructions.

Push the second pipe – also peeled and cleaned – into the socket

For a stable welding result it is important that both pipe ends inside the electrofusion socket are with parallel faces! Follow the minimum welding depth – absolutely!

Adjust the socket diameter on the welding device. Start and control welding process. Keep the cooling time. Finished!

Kind of stress	Compressive stress	Minimum waiting period
Tension, bend, torsion of unpressurized pipes		20 minutes
Test- or working pressure of pipes pressurized	up to 0.1 bar (1.5 psi) 0.1 up to 1 bar (1.5–14.5 psi) over 1 bar (14.5 psi)	20 minutes 60 minutes 120 minutes
Repeating of the welding process		60 minutes

POSSIBILITIES OF REPAIR

Pipe repairs with the aquatherm green pipe electrofusion socket

Cut squarely 3 to 4 lengths of a fitting out of the defect pipe, symmetrically to the defect. Fit the new pipe into this gap. Prepare the pipe ends of the existing pipe as in the case of a new welding.

Peel the new piece of pipe on both sides with the peeling tool on a length of more than the length of one fitting.

Unwrap two fittings and carefully move the fittings over both ends of the new pipe.

Then place the repair-pipe into the gap and move the fittings until they are aligned with the markings on the existing pipes.

Take care, that the fittings are exactly aligned and completely free of stress before welding.

Additional possibilities of repair

Damaged pipes may be repaired – as already mentioned – by means of

fusion (see Part B)
electrofusion socket (see Part F).

In addition to this the aquatherm PP-R-systems offers the possibility of the

pipe repair stick.

The necessary welding tool (Art. no. 50307/11) and repair stick (Art. no. 60600) are described on page 177.

The installation information is enclosed with the welding tool, but may also be ordered separately (Order-No. D 11450) from aquatherm.

Heat-up

Repair stick

Cutting

PART H: BUTT-WELDING OF PIPE DIMENSION

160–630 mm

The following aquatherm pipes series are available:

aquatherm green pipe SDR 11 S for cold water

aquatherm green pipe SDR 7.4 / 9 / 11 MF faser-composite pipe

aquatherm blue pipe SDR 11 / 17.6 MF faser-composite pipe

aquatherm blue pipe SDR 11 MF OT faser-composite pipe

Pipes and fittings are fused, as explained below, by butt welding:

1. Protect your place of work from weather influences
2. Check, if welding machine works properly and heat it up
3. Cut pipes into required length
4. Plastic pipes are aligned and fixed by means of the clamping elements
5. Use the milling machine for planing the pipe end to be plane-parallel
6. Remove the debris and clean the pipe ends with methylated spirit
7. Check if pipes match (tolerance: max. 0.1 x wall thickness)
8. Check width of gap between the two pipes to be welded (tolerance: max. 0.5 mm)
9. Check the temperature of the heating element (210 °C +/- 10 °C)
10. Clean the heating element

IMPORTANT:

Before welding, the side to be welded of the aquatherm blue pipe ot must be chamfered with the aquatherm chamfering tool (page 179).

To ensure an optimal weld joint, the heating plates' surfaces have to be cleaned before each welding process and be free of visible and invisible residues.

Before welding, pipes are cut into the required lengths

Check performance of the welding machine and heat it up

The parts to be welded are fixed and aligned respectively, the milling machine is used

Chamfering of the front side in case of the OT and UV pipe

PART H: BUTT-WELDING OF PIPE DIMENSION

160–630 MM

11. After the heating element has been positioned, the pipes are pushed onto the heating plate with a defined adjusting pressure.
12. After reaching the specified bead height (see tablet) the pressure is reduced. This process marks the beginning of the heating time. This time is for heating up the pipe ends up to the right welding temperature.

Specified bead height in mm:

	SDR 7,4	SDR 11	SDR 9	SDR 17,6
160 mm	1,5	1,0	1,0	1,0
200 mm	2,0	1,0	1,5	1,0
250 mm	2,0	1,5	2,0	1,0
315 mm	-	2,0	2,0	1,0
355 mm	-	2,0	2,5	1,5
400 mm	-	2,0	-	1,5
450 mm	-	2,5	-	1,5
500 mm	-	-	-	2,0
560 mm	-	-	-	2,0
630 mm	-	-	-	2,0

13. When heating time has expired, divide the machine slide, remove heating element quickly and join the pipes (by putting both parts of the slide together).
14. The pipes are fused with the required welding pressure and cooled down under pressure.
15. The welded connection can be unclamped – the welding process is finished.

Additionally please follow the instructions given in the operating manual of the welding machine and observe guideline DVS 2207, part 11.

Important Note

1. The welding machines have to be suitable for the welding of pipes with a diameter/wall thickness ratio of up to SDR 7.4

aquatherm recommends the following manufacturers of welding machines for butt welding:

Company Ritmo
Company Widos

2. For hydraulically operated welding machines, the real manometer pressure has to be calculated in consideration of the hydraulic piston area.

This value can be taken from the respective operating manuals.

Positioning of heating element

Divide the machine slide, remove heating element

Join the pipes, cool down under pressure

Unclamp and work on...

Visual inspection of fusion seam – Misalignment and gap width for butt welding

Gap width up to 355 mm outer diameter = 0.5 mm
 Gap width from 400 mm to 630 mm outer diameter = 1 mm

The misalignment cannot be more than 10% of the wall thickness or max. 2 mm

Welding defects during butt-welding

Normally a bead around the entire circumference is formed at the edge of the socket during the welding process. This bead indicates the proper welding. It is important to assure that the following welding defects are avoided:

Cracks

Grooves in the bead

Grooves and scratches

Misalignment of the joining area

Tilting of the joining area

Uneven welding bead

Lack of fusion at the joining area

Pores, voids and inclusion of impurities

Correct butt welded seam

The visual inspection may be only a first indication of the welding seam quality. But it is not a replacement for the leak test, which has to be carried out after the completion of the installation.

Requirements for welding

The immediate welding area is to be protected against bad climatic conditions (e.g. wind, moisture and low temperatures).

If the pipes are heated unevenly as a result of sun exposure, temperature compensation by timely covering of the welding area is to be created. Cooling down by draft during the welding process should be avoided.

For perfect welding joints, both the welding areas and tools must be clean and free of grease.

AQUATHERM WELDING PARAMETERS
WELDING TEMPERATURE: 210 °C +/- 10 °C

The calculated drag pressure is added to the adjustment and welding pressure (see description)

ATTENTION: When using other welding machines, the pressures P1, P2 and P3 must be adjusted.

Excerpt from the DVS 2207 part 11

Note: A reduction of the cooling time up to 50 %, i.e. release of the jointing pressure and removal of the welded part from the welding machine is allowed under the following conditions:

- The joint connection is manufactured under factory conditions and
- The removal from the welding machine and the temporary storage cause only a slight load to the joint connection and
- The joining parts have a wall thickness ≥ 15 mm

Further processing with full mechanical load on the jointing connection may be effected only after complete cooling down according to the table.

FLANGE CONNECTIONS

THE FOLLOWING MUST BE OBSERVED IN THE USE OF FLANGE CONNECTIONS:

Flange adapter respectively the sealing surfaces must always be aligned parallel to each other. A subsequent tightening of the flange connection after the welding process must be avoided. It is important to ensure that the flange faces are clean and undamaged.

The screw length should be selected so that the screw thread is as flush as possible, maximum two threads from the nut. To distribute the force of the screw head and the nut over a larger area, washers are used. Screws, nuts and washers must be clean and undamaged.

In order to achieve proper force distribution (surface pressure) acting on the seal, note the following:

- Screw joints must be tightened diagonally and evenly
- Torque information on the individual flanges must be observed (see table)

For flange connections, exposed to a mutual load, take care that they are checked as part of the maintenance and retightened, if necessary.

TORQUE FLANGE according to manufacturer's instructions

Art. no.	Dimension	DN specification	Nm
15712	32 mm	25	15
15714	40 mm	32	20
15716	50 mm	40	30

Following the table, tighten the given screw number to the desired torque value for the given round of tightening.

FASTENING TECHNIQUE / FIXED POINTS / SLIDING POINTS

Fastening technique

Pipe clamps for aquatherm PP-R-pipes must be dimensioned for the external diameter of the plastic pipe.

Take care, that the fastening material does not mechanically damage the surface of the pipe (aquatherm pipe clamps Art. no.: 60516–60660).

All pipes should be fastened with only aquatherm's green rubber compound fasteners, with expansion spacers, or other as deemed equal or approved by aquatherm and /or the project's Hydraulic Consultant.

Basically it must be distinguished on pipe assembly, whether the fastening material is used as

a fixed point or
a sliding point.

Fixed points

On locating fixed points the pipelines are divided into individual sections. This avoids uncontrolled movements of the pipe.

In principle fixed points have to be measured and installed in a way, that the forces of expansion of aquatherm PP-R-pipes as well as probable additional loads are accommodated.

On using threaded rods or threaded screws the drop from the ceiling should be as short as possible. Swinging clamps should not be used as fixed points.

Basically vertical distributions can be installed. Risers do not require expansion loops, provided that fixed points are located immediately before or after a branch.

To compensate the forces arising from the linear expansion of the pipe there must be sufficient and stable clamps and mountings.

aquatherm pipe clamps meet all mentioned requirements and – when considering the following installation instructions – are perfect for fixed point installations.

Sliding points

Sliding clamps have to allow axial pipe movements without damaging the pipe.

On locating a sliding clamp it has to be ensured that movements of the pipelines are not hindered by fittings or armatures installed next to the clamps.

aquatherm pipe clamps have an extra even and sliding surface of the sound insulation insert.

INSTALLATION ADVICE / LINEAR EXPANSION / CONCEALED INSTALLATION

Installation advices

aquatherm pipe clamps are perfectly suited for fixed point and sliding point installations.

The application of distance rings depends on the type of pipe.

Fastening	MF Pipes (faser composite pipe) & S Pipes (single layer)
Sliding Point	1 distance ring
Fixed point	no distance ring

Linear expansion

The linear expansion of pipes depends on the difference of operating temperature to installation temperature:

$$\Delta T = T_{\text{operating temperature}} - T_{\text{installation temperature}}$$

Therefore cold water pipes have practically no linear expansion.

Because of the heat dependent expansion of the material, the linear expansion must especially be considered in case of hot and heating installations. This requires a distinction of the types of installation, e.g.

- **Concealed installation**
- **Installation in ducts**
- **Open installation.**

Concealed installation

Concealed installations generally do not require a consideration of the expansion of aquatherm PP-R-pipes.

The insulation acc. to DIN 1988 or the EnEV (Energieeinsparverordnung) provides enough expansion space for the pipe. In the case where the expansion is greater than the room to move in the insulation, the material absorbs any stress arising from a residual expansion.

The same applies to pipes, which do not have to be insulated acc. to current regulations.

A temperature induced linear expansion is prevented by the embedding in the floor, concrete or plaster. The compressive strain and tensile stress arising from this are not critical as they are absorbed by the material itself.

INSTALLATION IN DUCTS

Installation in ducts (vertical)

Due to the different linear expansion of the aquatherm PP-R-pipes with or without stabilization, the installation of pipe branches in risers has to be made according to the selected type of pipe.

aquatherm green pipe MF **aquatherm blue pipe MF**

The linear expansion of aquatherm faser composite pipes in vertical risers can be ignored.

The positioning of a fixed point directly before each branch-off point is sufficient. All clamps in the riser must be installed as fixed points (see 1).

In general it is possible to install risers rigidly, that means without expansion joints. This directs the expansion on the distance between the fixed points, where it is ineffective.

For a maximum distance between two fixed points please refer pages 79/80.

aquatherm green pipe **aquatherm blue pipe** **aquatherm lilac pipe**

The installation of risers of aquatherm pipes without stabilizing components requires a branch pipe, which is elastic enough to take the linear expansion of the riser.

This can be ensured by a favourable fixing of the riser in the duct (see 2).

An adequate large pipe liner also gives sufficient elasticity to the branch-off pipe (see 3).

Furthermore the installation of a spring leg gives the appropriate elasticity (see 4).

When laying aquatherm pipes through the wall and ceiling, the fire protection must be observed (see pages 26-28).

Positioning of the fixed point clamp

Favourable fixing

Large diameter pipe liner

Installation of a spring leg

OPEN INSTALLATION / CALCULATION OF THE LINEAR EXPANSION

Open installation (horizontal)

In case of open installed pipes (e.g. in the basement), excellent optical characteristics and form stability are important. aquatherm pipes for cold water and aquatherm faser composite pipes for hot water and heating plants make this possible. The coefficient (α) of linear expansion of aquatherm composite pipes is only

$$\alpha_{\text{green pipe MS}} = 0,030 \text{ mm/mK}$$

$$\alpha_{\text{green pipe MF}} = 0,035 \text{ mm/mK}$$

and therefore nearly identical with the linear expansion of metal pipes.

The coefficient of linear expansion of aquatherm pipes without stabilizing components is

$$\alpha_{\text{green pipe}} = 0,150 \text{ mm/mK}$$

aquatherm faser composite pipes must have enough space to expand (see below). An expansion control is required for long and straight faser composite pipes (over 40 m).

aquatherm pipes without the stabilizing compound should have the expansion control after 10 m straight pipelines. The following formula, calculation examples, data-tables and diagrams help to determine the linear expansion. The difference between working temperature and maximum or minimum installation temperature is essential for the calculation of linear expansion.

Calculation of the linear expansion

Given and required values

Symbol	Meaning	Value	Measuring unit
ΔL	Linear expansion	?	[mm]
α_2	Coefficient of linear expansion aquatherm faser composite pipe	0,035	mm/mK
α_3	Linear expansion coefficient	0,15	mm/mK
L	Pipe length	25,0	[m]
T_B	Working temperature	60	°C
T_M	Installation temperature	20	°C
ΔT	Temperature difference between working and installation temperature ($\Delta T = T_W - T_M$)	40	K

The linear expansion ΔL is calculated according to the following formula:

$$\Delta L = \alpha \times L \times \Delta T$$

Example:

aquatherm green pipe MF faser composite pipe ($a = 0.035 \text{ mm/mK}$)

$$\Delta L = 0,035 \text{ mm/mK} \times 25,0 \text{ m} \times 40 \text{ K}$$

$$\Delta L = 35,0 \text{ mm}$$

Linear expansion comparison:

faser composite-
to standard PP-pipe

aquatherm green pipe & aquatherm blue pipe
(without faser)

The linear expansion, described on the preceding pages, can be taken from the following tables and graphs.

Linear expansion ΔL in [mm]: green and blue pipe - $\alpha = 0,150$ mm/mK

Pipe length	Difference in temperature $\Delta T = T_{\text{operating temperature}} - T_{\text{installation temperature}}$							
	10 K	20 K	30 K	40 K	50 K	60 K	70 K	80 K
	Linear expansion ΔL (mm)							
5 m	8	15	23	30	38	45	53	60
10 m	15	30	45	60	75	90	105	120

25 m	38	75	113	150	188	225	263	300
30 m	45	90	135	180	225	270	315	360
35 m	53	105	158	210	263	315	368	420
40 m	60	120	180	240	300	360	420	480
45 m	68	135	203	270	338	405	473	540
50 m	75	150	225	300	375	450	525	600

aquatherm green pipe MF (faser composite pipe)
aquatherm blue pipe MF (faser composite pipe)

Due to the integration and positive bond of the different materials, the aquatherm faser composite pipes offers much higher stability. The linear expansion reduces its value to $\frac{1}{5}$ of the mere PP-pipes.

Linear expansion ΔL in [mm]: aquatherm faser composite pipes - $\alpha = 0.035 \text{ mm/mK}$

Pipe length	Difference in temperature $\Delta T = T_{\text{operating temperature}} - T_{\text{installation temperature}}$

PIPE CLAMPS suitable as fixing point

From now on aquatherm offers fixed-point fastenings for pipes from 160 mm–630 mm (Art. no. 60768–60790). Packing unit is each with 1 piece.

Advantages:

- Reliable and permanent protection against perforation corrosion and breakdown of the static load capacity
- 1000 hours salt spray test without ferric oxide (rust)
- Suitable for installation in corrosive inner and outside areas
- Considerably higher corrosion protection than with electrogalvanized and hot-dip galvanized products (after spread test acc. to DIN EN ISO 9227)

BENDING SIDE

Linear expansion due to temperature difference between operating temperature and installation temperature can be compensated by different installation techniques.

Bending side

In most cases direction changes can be used to compensate for linear expansion in pipes.

The values of the bending side can be taken directly from the tables and graphs on the following pages.

Symbol	Meaning	
L_{BS}	Length of the bending side	[mm]
K	Material specific constant	15,0
d	Outside diameter	[mm]
ΔL	Linear expansion	[mm]
L	Pipe Length	[m]
FP	Fixed point	
GP	Sliding point	

Calculational determination of the bending side length

$$L_{BS} = K \times \sqrt{d \times \Delta L}$$

* support intervals on page 83

PRE-STRESS / BELLOW EXPANSION JOINT
Expansion loop

If the linear expansion cannot be compensated by a change in direction, it will be necessary to install an expansion loop with long and straight pipelines.

In addition to the length of the bending side L_{BS} the width of the pipe bend A_{min} must be considered.

Symbol	Meaning	
A_{min}	Width of the expansion loop	[mm]
SA	Safety distance	150 mm

The pipe bend A_{min} is calculated acc. to the following formula:

$$A_{min} = 2 \times \frac{\Delta L}{2} + SA$$

The width of the expansion loop A_{min} should be at least 210 mm.

Determination size of expansion loop

Example

Specification: Pipeline, length 80 m (MF pipe)

Determined expansion: $112 \text{ mm} = (\Delta L = \frac{0,035 \text{ mm}}{\text{mK}} \times 80 \text{ m} \times 40 \text{ K})$

The expansion loop should be installed exactly in the center of the pipe.

Calculation:

Given: $\Delta L = 112 \text{ mm}$
 $SA = 150 \text{ mm}$

Formula:

$$A_{min} = 2 \times \frac{\Delta L}{2} + SA$$

$$A_{min} = 2 \times \frac{112 \text{ mm}}{2} + 150 \text{ mm}$$

$$A_{min} = 262 \text{ mm}$$

The width of the expansion loop should be 262 mm in this example.

Pre-stress

Where space is limited, it is possible to shorten the total width A_{min} as well as the length of the bending side L_{BSV} by pre-stressing.

Pre-stress installations, if planned and carried out carefully, offer an optically perfect installation, as the linear expansion is hardly visible.

Symbol	Meaning	
L_{BSV}	Length of pre-stress	[mm]

The side length of expansion loops with pre-stress is calculated acc. to the following example:

$$L_{BSV} = K \times \sqrt{d \times \frac{\Delta L}{2}}$$

Below expansion joint

All bellow expansion joints for corrugated pipes designed for metal materials are unsuitable for aquatherm PP-R-pipes.

When using axial expansion joints observe the manufacturers instructions.

LENGTH OF BENDING SIDE

for aquatherm PP-R-pipes – the length of the bending side with pre-stress L_{BSV} can be taken from the tables and graphs in consideration of the applied pipe dimensions and determined linear expansion.

The decree for energy saving thermal protection and energy saving technique for buildings Decree for Energy Saving (EnEV) regulates the thermal insulation of hot water supplies and fittings in Germany.

Central heating pipes, line 1–4 installed in heated rooms or building parts between heated rooms of the one user, where heat output can be controlled by open stop valves do not require a minimum thickness of the insulation.

This even applies to hot water pipes up to an inner diameter of 22 mm in flats, which are neither in the circulation nor have an additional electric heating.

Applying material with thermal conductivities different to 0.035 W/(mK) the minimum thickness of the insulation has to be converted correspondingly.

For the conversion and the thermal conductivity of the insulation the ways and values of calculation described in the technical regulations must be applied.

The minimum insulation acc. to the table for heating distributions and heating pipes can be reduced as far as the same limit of heat output even for further insulation requirements in consideration of the insulating effect of the pipe walls are guaranteed.

Cooling pipes must be provided with suitable insulation to prevent condensation. For further information please contact our service hotline +49 2722 950-200

EnEV 2009, § 14, addendum 5, chart 1

Line	Type of pipe/fitting	minimum thickness of insulation referred to thermal conductivity of 0.035 W/(mK)
1	inner diameter up to 22 mm	20 mm
2	inner diameter more than 22 mm up to 35 mm	30 mm
3	inner diameter more than 35 mm up to 100 mm	same as inner diameter
4	inner diameter more than 100 mm	100 mm
5	pipes and fittings after line 1–4 in wall- and ceiling openings, in crossing area of pipes, at pipe connections, at distributors	½ of the requirements of line 1 to 4
6	pipes of central heating after line 1–4, which have been installed after introduction of this decree between heated rooms of various users	½ of the requirements of line 1 to 4
7	pipes after line 6 in floor construction	6 mm
8	Cooling distribution and cold water pipes and fittings of air handling and air conditioning systems	6 mm

INSULATION THICKNESS ACC. TO DECREE FOR ENERGY SAVING

Acc. to this decree aquatherm PP-R-pipes and fittings have to be insulated against loss of heat. The insulation thickness depends on the respective installation.

The heat conductivity figure of fusiolen® PP-R is 0.15 W/(mK) aquatherm PP-R-pipes and fittings offer a significantly higher degree of insulation compared to metal pipes.

Due to the high insulation values of the pipe-material PP-R the insulation thickness – compared to metallic pipe systems – can be reduced.

Undermentioned are the recommendation based on EnEV 2009. Regional standards might vary and are to be considered.

Thermal insulation from heat distribution and hot water pipes, cooling distribution and cold water pipes acc. EnEV 2009

Minimum thickness of insulation referred to thermal conductivity of 0.035 W/(mK)

pipe diameter	50 %	100 %

PRESSURE TEST/TEST CONTROL/ MEASURING OF THE TEST PRESSURES/TEST RECORD

Pressure test/Test control

All aquatherm pipe systems shall be subjected to a hydraulic pressure test with a test-pressure of 10 bar.

The material properties of the aquatherm pipe systems result in an expansion of the pipes during the pressure test. This affects the test result. Due to the thermal expansion coefficients of the aquatherm pipe systems the results are influenced additionally. The temperature differences between the pipe and the test medium lead to changes in pressure. Hereby a temperature change of 10 K corresponds to a pressure difference of 0,5 up to 1 bar.

Therefore pressure testing of the aquatherm pipe systems should be made with a constant temperature of the test medium. The hydraulic pressure test requires a preliminary, principal and final test.

In the preliminary test a pressure of **18 bar*** is applied 3 x 5 minutes for the expansion/release of the pipes. Between the cycles the pipe system must be depressurized.

Immediately after the preliminary test the principal test should be performed. The test duration is 15 min. Here, the test pressure (10 bar) may not fall more than 0,5 bar.

After completion of the preliminary and principle test finally the final test must be performed.

The test duration is 60 minutes. Here, the test pressure – read after the principle test – may not fall more than 0,5 bar.

Measuring of the test pressures

A mechanical (U tube or Bourdon gauge) manometer is to be used for the measurement. The manometer has to be placed at the deepest point of the installation. Digital manometers are not suitable for the aquatherm blue pipe.

Test record

A record of the hydraulic pressure test has to be prepared and signed by the client and contractor stating place and date (see page 89).

*** Exception: aquatherm blue pipe SDR 17.6: 10 bar**

FLUSHING OF PIPES / EARTH WIRE / TRANSPORT AND STORAGE

Flushing of pipes

The technical rule for potable water installations (TRWI)

DIN 1988, Part 2

includes a paragraph about the flushing of pipes, which has to be carried out with an air-water-mixture under pressure.

Basically all potable water plants, independent of their material, have to be flushed thoroughly after their installation. The following requirements have to be complied with before the installation can be put into service:

- Protection of the potable water quality
- Avoidance of corrosion damage
- Avoidance of malfunctions of armatures and apparatus.
- Cleanliness of the inner surface of the pipe

These requirements are met by

- Flushing with water
- Flushing with air-water-mixture

On choosing the type of flushing required, the experiences of the installer, the requirements of the client and the instructions of the system manufacturer have to be observed.

For potable water installations acc. to DIN 1988, the aquatherm green pipe system complies with, "1 – flushing with water" is sufficient.

The aquatherm green pipe system complies with DIN 1988 for potable water installations. Thus, flushing with water is sufficient, acc. to procedure 1 stipulated therein.

For this reason it is sufficient to flush the installation with water only.

Earth wire

DIN VDE 0100, Part 701 contains safety measures for rooms containing baths or showers. Among other aspects, this standard regulates the potential balance for such rooms.

The standard stipulates that all conductive components such as metal baths and shower trays, metal outlet valves, metal stench traps and metal pipe systems (e. g. drinking water and heating pipe systems) must be connected to each other.

The connection to an earth conductor must be provided, at a central point, e.g. in the building's mini-distributors installation (power circuit distributors).

Information on renovating potable drinking water pipe systems using aquatherm green pipes:

Where metal pipes are replaced by aquatherm green pipes, the potential balance can not be created by the water pipes.

It should be ensured that the potential balance is checked out by a qualified electrician.

Transport and storage

aquatherm PP-R-pipes may be stored outside at any temperature. A solid base for the pipe is very important to avoid a deformation of the pipes while in transport and storage.

At temperatures below 0 °C it is possible to damage the pipes through strong impacts. The material has to be treated with caution at low temperatures.

In spite of its high resistance aquatherm pipes should be treated with care.

UV-radiation has effects on all high polymer plastics. Do not store permanently outdoor. Maximum storage time (outdoor) is 6 months.

WATER POINT CONNECTIONS

aquatherm green pipe back plate elbow for twin water point connections with galvanized mounting plate and sound insulation plate (Art. no. 79080) from the fixing program (gauge for bore holes 220-153-80 mm)

aquatherm green pipe back plate elbow for dry construction installed in a pipe chase

Mounting unit twin (gauge for bore holes 80-100-150 mm) incl. 2 aquatherm green pipe transition elbows female/male with counter nut, gasket and spring washer

aquatherm green pipe transition elbow female/male for dry construction with 30 mm thread

aquatherm green pipe dry construction wall fitting with transition elbow

The aquatherm green pipe transition elbow with female/male thread is suitable for flushing box connections. This transition elbow is also available with a single mounting unit.

**DISTRIBUTION BLOCK:
EXAMPLE OF APPLICATIONS**

Example of applications

The stamped numbers 1 and 2 indicate the proper connection of the aquatherm green pipe distribution block. They provide assistance with the installation.

In case of the "heating" connection variant (top A), the return is connected to the supply channel marked 1 and the flow to supply channel marked 2. The connections can also be used reverse.

In potable water connection variant (top B), supply channel 1 is intended for the cold water pipe and supply channel 2 for the hot water pipe connection. In as-delivered condition, the lower outlets are closed. The connection with supply channel 2 is made by drilling out (18 mm drill bit). Thus an additional pipe can be connected.

By turning the aquatherm green pipe distribution block a mirror-image connection can be made. These variants are presented in the illustrations C and D.

The flow and return connections of the aquatherm green pipe distribution block heating are installed with Ø 20 mm pipes. For radiator connections Ø 16 mm pipes have to be welded into the outflow sockets of the distribution block.

The aquatherm green pipe distribution block plumbing has to be connected with Ø 25 mm pipes. For pipe connections to the taps, Ø 20 mm pipes have to be welded into the outflow sockets of the distribution block.

DISTRIBUTION BLOCK:

EXAMPLE OF APPLICATIONS – POTABLE WATER

The connection pipes in the individual floors or risers are connected for hot and cold water with aquatherm PP-R-pipes with an external diameter of 25 mm. The same applies for also for the hot water return which can be led back from any aquatherm green pipe distribution block.

Reducers for further pipe systems can be welded directly onto the distribution block.

The supplied 25 mm end plug seals off a through-flow unit or, alternatively, the 16 mm end cap. By cutting the end of the plug, it can be used as 25 mm to 16 mm reducer or as 16 mm socket.

By turning the aquatherm green pipe distribution block and drilling out the factory-sealed outlets, it is possible to create compact connection arrangements even in areas of restricted space.

This avoids the time-consuming operation of guiding under or over pipes and the associated sealing work.

INSULATION FOR DISTRIBUTION BLOCK / AQUATHERM DISTRIBUTION BLOCK

Insulation for distribution block

It is also possible to install the compact distribution block by using a specially adapted insulation. In this case the green junction does not only avoid the crossing of pipes, but also the extra work involved in the expensive insulation of the double tee-branch.

The insulation for the aquatherm green pipe distribution block is made from high-quality PPO/PS rigid expanded polyurethane. Thus, a fast, unproblematic and safe insulation acc. to the current Decree for the Installation of Heating Systems is provided.

Thermal conductivity: WLG 040

Length: 184 mm

Width: 119 mm

Height: 70 mm

The accessories (1 plug, 2 fastening plugs) are integrated in the supply unit aquatherm green pipe distribution block.

aquatherm green pipe distribution block

If the radiator connection is not in the immediate vicinity of the pipe connection of the distribution block, this supply can be arranged with a 16 mm pipe by welding-in of two reducers 20/16 mm (Art. no. 11109).

distribution block

**AQUATHERM DISTRIBUTION BLOCK:
EXAMPLE OF APPLICATIONS – HEATING**

The flow and return connections of heating pipes to the aquatherm distribution block are with aquatherm PP-R-pipes of an external diameter of 20 mm. Used in conjunction with the aquatherm connecting bend (Art. no. 85120) and the aquatherm radiator valves (Art. no. 79606 or 79608), the outgoing 16 mm pipe connections are ideal for radiator connections.

It is of no importance, where the heating flow or return is connected to the aquatherm distribution block. A simply turning of the distribution block adapts it to the appropriate specification.

CHEMICAL RESISTANCE

Due to their special material properties aquatherm green pipe resp. aquatherm blue pipe and fittings are generally chemical resistant. However, aquatherm green pipe transition elements with thread inserts made of brass are not suitable for all media.

For industrial application of aquatherm green pipe and aquatherm blue pipe we recommend to use aquatherm green pipe flanges and/or coupling screws.

Note: On request, you will receive threaded inserts for aquatherm green pipe connecting pieces also in stainless steel.
Prices on request.

PLANNING

**DIN 1988 T3 / MAXIMUM FLOW RATE /
PRINCIPLES OF CALCULATION / CALCULATION GUIDE / SOFTWARE**

DIN EN 806 PART 3 AND DIN 1988 PART 300

DIN EN 806 part 3 and DIN 1988 part 300 (Technical Rules for Potable Water Installations) specifies the calculation principles for the determining of the pipe diameter.

The determining of the pipe diameter is based on the calculation of the pressure loss in pipes.

Beside the diameter the pressure loss depends on the length of the pipe, the pipe material and on the flow rate, dependent on the quantity and size of the water points to which the pipe is connected.

The basis for determining the maximum flow rate should be calculated on the desired flow rate of each water point. The simultaneous use resp. the peak pressure of flow of an installation part has to be determined by taking the calculation values from DIN 1988 T 3 as a basis.

Maximum flow rate

A further criterion for the selection of the pipe diameter is the maximum permissible flow rate. Because of sonic reasons and for the limitation of water hammer, the calculated flow rate may not exceed the values of the table below.

DIN EN 806-part 3

Collective supply pipes, riser pipes, storey pipes max. 2,0 m/s;
Individual supply pipes max. 4,0 m/s

NOTE: National regulations may require lower flow rates to avoid water hammers and noises.

DIN1988 part 300 table 5 – Maximum calculated flow rate in case of the related peak flow

Section of the installation	max. calculated flow rate at run (m/s)	
	< 15 min.	≥ 15 min.
Connecting pipes (Building connection)	2	2
Supply pipelines: Sections with resistance coefficients $\zeta < 2,5$ for individual resistances ^a	5	2
Sections with resistance coefficients $\zeta \geq 2,5$ for individual resistances ^b	2.5	2

^a i. e. piston valves acc. to DIN 3500. ball cock. inclined valves acc. to DIN 3502 (from DN 20)

^b i. e. screw-down stop globe valves acc. to DIN 3512

Principles of calculation

To determine the pipe diameter in potable water networks of buildings numerous principles of calculation are necessary. The revised version of DIN 1988 provides a simplified and differentiated method of calculation.

The simplified method is suitable for clearly arranged pipes i. e. in residential buildings. The differentiated method includes all pipes and local resistances and offers the highest accuracy as well as the most accurate approximation of real operating conditions. The determining of the pipe diameter requires the following data:

- Minimum gauge pressure of supply or pressure in flow direction behind pressure reducing or boosting valve
- Head variations
- Pressure loss due to apparatus i. e. watermeter, filter, softening installations etc.
- Minimum flow pressure of the water point applied
- Pipe friction factor of the used pipe material
- Coefficients of loss for fittings and pipe connections

Calculation guide / Software

We provide data sets for the following calculation programmes:

- MagiCAD
- liNear

Further data set formats can also be downloaded from our homepage:

- RFA
- STP
- IPT
- DWG

For any questions, please contact our aquatherm information service:
+ 49 (0) 2722 950-0

MINIMUM FLOW PRESSURE

Calculated flows of common water points

Minimum flow pressure $p_{\min, Fl}$	Type of water point		Calculated flow on taking:		
			mixed water ¹⁾		only cold or heated potable water
			V_R cold	V_R warm	V_R
bar	Designation		l/s	l/s	l/s
	Taps				
0.5	without air inlet (airator) ²⁾	DN 15	-	-	0.30
0.5	without air inlet (airator) ²⁾	DN 20	-	-	0.50
0.5	without air inlet (airator) ²⁾	DN 25	-	-	1.00
1.0	with air inlet (airator)	DN 10	-	-	0.15
1.0	with air inlet (airator)	DN 15	-	-	0.15
1.0	Shower heads for purification showers	DN 15	0.10	0.10	0.20
1.2	Flush valves acc. to DIN 3265 Part 1	DN 15	-	-	0.70
1.2		DN 20	-	-	1.00
0.4		DN 25	-	-	1.00
1.0	Flush valves urinals	DN 15	-	-	0.30
1.0	Domestic dish washers	DN 15	-	-	0.15
1.0	Domestic washing machine	DN 15	-	-	0.25
	Mixing battery for:				
1.0	Shower-bathes	DN 15	0.15	0.15	-
1.0	Bath-tubs	DN 15	0.15	0.15	-
1.0	Kitchen sinks	DN 15	0.07	0.07	-
1.0	Washstands	DN 15	0.07	0.07	-
1.0	Bidets	DN 15	0.07	0.07	-
1.0	Mixing battery	DN 20	0.30	0.30	-
0.5	Flushing- box DIN 19542	DN 15	-	-	0.13
1.0	Electro boiler	DN 15	-	-	0.10 ³⁾

COMMENT:

All other water points and apparatus of the above type with larger armature passages or minimum pressures of flow have to be considered with determining the pipe diameter acc. to the manufacturer`s instructions.

- ¹⁾ The calculated flows of mixed water points are based on 15 °C for cold potable water and 60 °C for hot potable water.
- ²⁾ In case of taps without air inlet (airator) and with hose screw, the loss of pressure in the hose pipe (up to 10 m length) and in the connected apparatus (i.e. lawn sprinkler) is considered over the minimum pressure of flow. The minimum pressure of flow is increased by 1.0 bar to 1.5 bar.
- ³⁾ In case of fully opened flow control valve.

MINIMUM FLOW PRESSURE

Determination of the peak flow rate V_S from the total flow $\sum V_R$ for buildings

acc. to DIN 1988 Teil 3 $V_S = 0.682 \cdot (\sum V_R)^{0.45} - 0.14$ [l/s]

$\sum V_R$	V_S	$\sum V_R$	V_S	$\sum V_R$	V_S	$\sum V_R$	V_S	$\sum V_R$	V_S	$\sum V_R$	V_S	$\sum V_R$	V_S	$\sum V_R$	V_S

Source: DIN 1988 Part 3

(→ = flow direction)

$$Z = \frac{\zeta v^2 \delta}{2}$$

Z = Pressure lost in [Pa]

v = Flow rate [m/s]

ζ = Coefficient of loss of fitting

δ = Density of medium [kg/m³]

(K_v = Cold Water Volume Rate circulatory [m³/h] of water [5–30 °C] at a pressure difference of 1 bar)

Note: For the determination of pressure loss in (mbar) the result has to be divided by the factor 100 (100Pa = 1 mbar).

1bar = 10⁵ Pa = 14,5 psi = 10 N/cm²)

Notice on planning & design of compressed air applications

When planning and designing pipe systems for compressed air applications, the following working pressures are to be observed.

aquatherm blue pipe SDR 11	aquatherm green pipe SDR 9
10 bar	15 bar

This chart is valid for temperatures from 10 °C to 40 °C. For temperatures and conditions other than those noted in the chart, please contact our technical service department.

Warning: Failure of a compressed gas (air or inert gas) system can be extremely violent and dangerous. In a compressed gaseous media piping system, energy is applied to compress the gaseous media in addition to pressurizing the system. If failure occurs, both energies can be suddenly released and can be extremely violent compared to failure during leak testing or system operation with an incompressible liquid testing media.

aquatherm recommends that thermoplastics piping intended for the transport of compressed air or other compressed gases should be installed by burial, encasement in shatter-resistant material or other appropriate means, to prevent or minimize the possibility of mechanical damage. The piping must also be protected from other sources of degradation such as ultraviolet light (UV) exposure, chemical effects, temperature and oxidation.

Always make sure to eliminate risks for persons near compressed air systems, also observing the applicable national and international regulations of installation, accident prevention and safety for the installation of pipe systems, as well as the applicable laws, standards, guidelines and technical rules.

aquatherm green pipe

The innovative all-rounder, which revolutionized the plastic pipe sector, made a name for itself within a very short time that stands for highest quality and outstanding ecological properties. The aquatherm system has proven its excellent technical suitability in more than 30 years of application worldwide, and among experts has long been one of the most extensive and at the same time best plastic pipe systems.

The system includes the different types of pipes SDR 6, SDR 7.4, SDR 9 and SDR 11. These are supplemented by the especially reinforced fiber composite pipe. More than 450 joining and connection elements as well as valves and ball valves complete the system. The products are available from 16 mm to 450 mm external diameter.

MANIFOLD CONSTRUCTION – CUSTOM MADE

We design and construct your manifolds in our company according to your specifications and dispatch them pre-finished to any place of the world.

You only have to send us the drawings and/or sketches with specifications. We return the offer including material list and drawing. A qualified team of experienced technicians likes to assist you.

For detailed information referring "manifold construction" please contact our technical hotline: +49 (0) 2722 950-200!

aquatherm green pipe SDR 9 MF RP

Structure of pipe:	MF = multilayer, with fibre reinforced
Special feature of pipe:	RP (raised pressure)
Material:	fusiolen PP-R
Pipe series:	SDR 9/S 4
Standards:	SKZ HR 3.28, ASTM F 2389, ISO 21003 SKZ A632/A644
Colour:	green with 4 dark green stripes
Form supplied:	ø 32–125 mm straight lengths 4 m ø 160–355 mm straight lengths 5.8 m
Packing Unit:	PU in meter
Application:	

Mechanically stabilized through a fibre mix integrated in the middle layer of the fusiolen® PP-R.

aquatherm green pipe SDR 9 MF RP UV

- Structure of pipe:** MF = multilayer, with fibre reinforced
- Special feature of pipe:** RP (raised pressure), UV resistant
- Material:** fusiolen PP-RP
- Pipe series:** SDR 9/S 4
- Standards:** SKZ HR 3.28, ASTM F 2389, ISO 21003, SKZ A632/A644
- Colour:** inner layer: green with 4 dark green stripes
outer layer: black
- Form supplied:** ø 32–125 mm straight lengths 4 m
ø 160–355 mm straight lengths 5.8 m
- Packing Unit:** PU in meter
- Application:**

Resistant against UV-rays. Mechanically stabilized through a faser mix integrated in the middle layer of the fusiolen® PP-R.

aquatherm green pipe SDR 11 S / MF

- Structure of pipe:** 20–355 mm = s (single)
400&450 mm = MF (multilayer faser)
- Material:** fusiolen PP-R
- Pipe series:** SDR 11/S5
- Standards:** DIN 8077 / 78, DIN EN ISO 15874, ASTM F 2389, CSA B 137.11
- Colour:** green with 4 blue stripes
- Form supplied:** ø 20–125 mm 4 m straight lengths, also* in coils
ø 160–450 mm straight lengths 5,8 m
- Packing Unit:** PU in meter

aquatherm blue pipe

aquatherm blue pipe, our specialty for distributing cooling and heating in closed and open systems as well as in several industrial applications. It was developed in order to prevent corrosion in heating system pipes *sowie in Kühl- und Kälteanlagen* and quickly expanded its range of application, with many positive features for other fields of piping installation. It has gone on to find success around the world in hotels, stadiums, schools, offices, and industrial applications. In addition to the general advantages of the PP-R-pipesystem aquatherm blue pipe in comparison with the aquatherm green pipe system it offers higher volumetric current values due to smaller wall thickness.

Pipe system made of polypropylene

for chilled, hot fluid and various industrial applications

MANIFOLD CONSTRUCTION – CUSTOM MADE

We design and construct your manifolds in our company according to your specifications and dispatch them pre-finished to any place of the world.

You only have to send us the drawings and/or sketches with specifications. We return the offer including material list and drawing. A qualified team of experienced technicians likes to assist you.

For detailed information referring "manifold construction" please contact our technical hotline: +49 (0) 2722 950-200!

aquatherm blue pipe SDR 7.4 / 11 / 17.6 MF

Structure of pipe:	MF = multilayer, with fibre reinforced
Material:	fusiolen PP-R
Pipe series:	SDR 7.4 / S 3.2 & SDR11 / S 5 & SDR 17.6 / S 8.3
Standards:	SKZ HR 3.28, ASTM F 2389, CSA B 137.11, ISO 21003
Colour:	blue with 4 wider green stripes
Form supplied:	ø 20–125 mm straight lengths 4 m ø 160–630 mm straight lengths 5.8 m
Packing Unit:	PU in meter
Application:	

Mechanically stabilized through a fibre mix integrated in the middle layer of the fusiolen® PP-R.

aquatherm blue pipe SDR 7.4/11/17.6 MF UV

- Structure of pipe:** MF = multilayer, with fibre reinforced
Special feature of pipe: UV resistant
Material: fusiolen PP-R
Pipe series: SDR 7.4/S 3.2 & SDR11/SDR 17.6 / S 8.3
Standards: SKZ HR 3.28, ASTM F 2389, CSA B 137.11, ISO 21003
Colour: outside: black, inside: blue
Form supplied: ø 20–125 mm straight lengths 4 m
 ø 160–630 mm straight lengths 5.8 m

**Packing Unit:** PU in meter**Application:**

UV-resistant. Mechanically stabilized by a fibre mixture, integrated in the middle layer of fusiolen PP-R.

aquatherm blue pipe SDR 7.4 / 11 MF OT

- Structure of pipe:** MF = multilayer, with fibre reinforced
Special feature of pipe: OT = oxygen tight
Material: fusiolen PP-R
Pipe series: SDR 7.4/S 3.2 & SDR11 / S 5
Standards: DIN 8077 / 78, DIN EN ISO 15874, ASTM F 2389, CSA B 137.11, ISO 21003
Colour: blue
Form supplied: ø 20–125 mm straight lengths 4 m
 ø 160–250 mm straight lengths 5,8 m
Packing Unit: PU in meter
Application:

Oxygen tight by diffusion barrier. Mechanically stabilized through a fibre mix integrated in the middle layer of fusiolen® PP-R.

aquatherm lilac pipe

aquatherm lilac pipe was developed exclusively for the field of water recycling. In countries that are highly committed to the environment, like Australia and California, it is already standard to reduce daily water consumption by using recycled water when possible. Now lilac is also regarded in other countries as a standard colour for greywater pipes. For technical, commercial, agricultural or domestic applications, cost-effective process water is often required. In the private sector, water recycling-systems are increasingly used. Thanks to the long-lasting and corrosion-resistant material Polypropylene, the aquatherm lilac pipe is ideally suited for process water (grey/rainwater).

ELBOW 90° BUTT WELDING

Systems: aquatherm green pipe, aquatherm blue pipe

Material: Fusiolen® PP-R & PP-RP

Standard: DIN 16962, DIN EN ISO 15874

Notice There is a gradual conversion of the XXL-fittings made of pipe segments to an injection molded design. The table shows which articles are already available in new design at the time of printing this catalogue. In the aquatherm technews we will inform you of further changes, but first the current stock of the elbows made of pipe segments has to be sold.

All fittings, which are converted to the injection molding production, are still available on inquiry as special fittings made of pipe segments. No article numbers are defined for special fittings of any type.

Please note! Electrofusion sockets can not be processed directly with injection molded fittings. When using electrofusion sockets either segment welded special fittings must be used or pipe pieces must be welded to the injection molded fittings.

Fitting made of pipe segments

Injection molded fitting

Fitting made of pipe segments

Injection molded fitting
Colour: green

Notice

There is a gradual conversion of the XXL-fittings made of pipe segments to an injection molded design. The table shows which articles are already available in new design at the time of printing this catalogue. In the aquatherm technews we will inform you of further changes, but first the current stock of the elbows made of pipe segments has to be sold. All fittings, which are converted to the injection molding production, are still available on inquiry as special fittings made of pipe segments. No article numbers are defined for special fittings of any type.

Please note! Electrofusion sockets can not be processed directly with injection molded fittings. When using electrofusion sockets either segment welded special fittings must be used or pipe pieces must be welded to the injection molded fittings.

aquatherm blue pipe Y-PIECES

Special fittings on demand

ATTENTION – PLEASE NOTE!

These branches are for special applications in the **unpressurized** areas, e.g. in vacuum dewatering in the ship building. **In no case** they may be exposed to the pressures, given in the working pressure tables on page 25–27.

RED.-T-PIECE, SOCKET- & BUTT WELDING

Systems: aquatherm green pipe, aquatherm blue pipe
Standard: DIN 16962, DIN EN ISO 15874
Colour: green
Form: see table

Fitting made of pipe segments

Injection molded fitting

Note: There is a gradual conversion of the XXL-fittings made of pipe segments to an injection molded design. The table shows which articles are already available in new design at the time of printing this catalogue. In the aquatherm technews we will inform you of further changes, but first the current stock of the red.-t-pieces made of pipe segments has to be sold.

All fittings, which are converted to the injection molding production, are still available on inquiry as special fittings made of pipe segments. No article numbers are defined for special fittings of any type.

Please note! Electrofusion sockets can not be processed directly with injection molded fittings. When using electrofusion sockets either segment welded special fittings must be used or pipe pieces must be welded to the injection molded fittings.

50357**	ø 315-630mm	885,000	1		

The butt-welding-machine can be purchased directly from Widos (www.widos.de)

* Also available in design with 110 volt (Art. no. 450352 = ø 160–250 mm / 450353 = ø 160–315 mm / 450354 = ø 160–355 mm / 450355 = ø 200–450 mm)

** special voltage on demand

MANUAL WELDING DEVICE (1500 W) FOR SADDLE WELDING Ø 50–160 MM

Art. no.	for pipe dimensions	PU	Box unit	Price € m/pc
50330	ø 50-160mm	1		

BUTT WELDING MACHINE RITMO

Art. no.	for pipe dimensions	Weight [kg]	PU	Box unit	Price € m/pc
50165*	ø 160-250mm	176,500	1		
50166*	ø 160-315mm	160,000	1		
50177	ø 160-355mm	336,500	1		
50169	ø 400-630mm	710,000	1		

including wooden transport box. The butt welding machine can be obtained directly from Ritmo (www.ritmo.it)

* Also available: 110 V (Art. no. 450165 for ø 160–250 mm / Art. no. 450166 for ø 160–315 mm)

Two-ring machine for pipes 160–355 mm available on request

ELECTROFUSION DEVICE

Art. no.	for pipe dimensions	PU	Box unit	Price € m/pc
50175	ø 20-250mm	1		

For processing with electro-fusion-sockets Art. no. 17208–17238.

Special calibration-tools – obtainable on request – are required

TEMPERATURE PENCIL

Art. no.	Dimension	PU	Box unit	Price € m/pc
50190		1		

to check the correct welding temperature

SURFACE THERMOMETER

Art. no.	Dimension	PU	Box unit	Price € m/pc
50188		1		

to check the correct welding temperature

TEMPERATURE PREDECTIVE GLOVE

for tool change

Art. no.	Dimension	PU	Box unit	Price € m/pc
50195		2		

CLEANING WIPES

Art. no.	Dimension	PU	Box unit	Price € m/pc
50193	Box/100 towels	1		

for electrofusion sockets

WELDING TOOLS

Art. no.	Dimension [mm]	PU	Box unit	Price € m/pc
50206	16	1		
50208	20	1		
50210	25	1		
50212	32	1		
50214	40	1

50226	125	1		

REPAIR SET

Art. no.	Dimension	PU	Box unit	Price € m/pc
50307	7mm	1		
50311	11mm	1		

to close holes of up to 10 mm in the pipe (pipe repair stick Art. no. 60600)

PIPE REPAIR STICK

for pipe repairs

Art. no.	Dimension	PU	Box unit	Price € m/pc
60600	7/11mm	10		

aquatherm UNIVERSAL PEELING TOOLS

for aquatherm green pipe MF UV, aquatherm green pipe MF RP UV, aquatherm blue pipe MF UV and aquatherm blue pipe MF OT

Required for the socket welding

(in combination with socket welding fittings from page 122 onwards, e.g. sockets, elbows, T-pieces, transition pieces with thread)

Also suitable for manual peeling (bolts included)

Art. no.	Dimension [mm]	PU	Box unit	Price € m/pc
50479	20	1		
50480	25	1		
50481	32	1		
50482	40	1		
50483	50	1		
50484	63	1		
50485	75	1		
50486	90	1		
50487	110	1		
50488	125	1		
50501	Spare blade with screw	1		

incl. bolts
for manual peeling

not suitable for aquatherm green pipe S, aquatherm blue pipe S, aquatherm green pipe MF, aquatherm blue pipe MF, aquatherm green pipe MF RP, aquatherm green pipe TI, aquatherm blue pipe TI

S = single, **MF** = multilayer fibre, **OT** = oxygen tight, **UV** = ultraviolet protected, **TI** = thermal insulation, **RP** = raised pressure

aquatherm EXTENSION FOR UNIVERSAL PEELING TOOL

Required for the electrofusion socket welding
(aquatherm electrofusion sockets on page 149)

When electrofusion welding a longer welding depth is required, which is achieved by the combination of the universal peeling tool and the extension for the universal peeling tool (e.g. Art. no. 50479+50489)

Art. no.	Dimension	PU	Box unit	Price € m/pc
50489	for peeling tool 20 mm Art. no. 50479	1		
50490	for peeling tool 25 mm Art. no. 50480	1		
50491	for peeling tool 32 mm Art. no. 50481	1		
50492	for peeling tool 40 mm Art. no. 50482	1		
50493	for peeling tool 50 mm Art. no. 50483	1

50495	for peeling tool 75 mm Art. no. 50485	1		
50496	for peeling tool 90 mm Art. no. 50486	1		
50497	for peeling tool 110 mm Art. no. 50487	1		
50498	for peeling tool 125 mm Art. no. 50488	1		

ATTACHMENT PLATE FOR UNIVERSAL PEELING TOOL

In combination with or without extension for universal peeling tools for drilling machine

Art. no.	Dimension	PU	Box unit	Price € m/pc
50499	for universal peeling tool 50479 – 50484	1		
50500	for universal peeling tool 50485 – 50488	1		

Delivery without drilling machine!

UNIVERSAL PEELING TOOL-SET

20–63 mm

Art. no.	Dimension	PU	Box unit	Price € m/pc
50477	for ø 20–63 mm	1		

consisting of:

- 1x case
- Each 1x 50479–50484 peeling tool 20–63 mm
- 1x 50499 attachment plate for universal peeling tool 50479–50484
- 1x 50503 1 toggle-set
- 1x 50504 torx wrench
- 1x 50505 hexagon Allen key size 4
- 6x 99793 6 fixing screws for Art. no. 50489–50494 M5x25

UNIVERSAL PEELING TOOL-SET

75–125 mm

Art. no.	Dimension	PU	Box unit	Price € m/pc
50478	for ø 75 - 125 mm	1		

consisting of:

- 1 x case
- Each 1x 50485–50488 peeling tool 75–125 mm
- 1x 50500 attachment plate for universal peeling tool 50485–50488
- 1x 50503 1 toggle-set
- 1x 50504 torx wrench
- 1x 50505 hexagon Allen key size 4
- 6x 99794 6 fixing screws for Art. no. 50495–50498 M5x35

MANUAL SCRAPER FOR aquatherm blue pipe OT PIPES

Art. no.	Dimension	PU	Box unit	Price € m/pc
50509	with 4-fold blade, 35 mm wide	1		

For removal of OT-coat before butt-welding.
In addition the manual scraper can be used for removal of oxid coating for the E-socket welding.

SPARE BLADE SET FOR ART. NO. 50509

Art. no.	Dimension	PU	Box unit	Price € m/pc
99909	2 pieces = 1 set	1		

CHAMFERING TOOL FOR aquatherm blue pipe OT UND UV PIPES

Art. no.	Dimension	PU	Box unit	Price € m/pc
50510	32-250mm	1		

For removal of oxid coating before butt-welding.

aquatherm PEELING TOOLS FOR ELECTROFUSION SOCKET WELDING (ART. NO.17208–17238)

for aquatherm green pipe S, aquatherm green pipe MF, aquatherm green pipe MF RP, aquatherm green pipe MF TI, aquatherm blue pipe S, aquatherm blue pipe MF and aquatherm blue pipe MF TI

Required to remove the **oxid coating**
(aquatherm electrofusion sockets on page 149)

Art. no.	Dimension [mm]	PU	Box unit	Price € m/pc
<i>In combination with a drilling machine</i>

HOT TAPPING TOOL

for drilling of pipes under pressure

The hot tapping tool (Art. no. 50890) is used for drilling pipes for branch connections in the dimensions 40 and 63 mm.

The PP-main pipes aquatherm green pipe, blue pipe and lilac pipe with the **pipe structure S and MF UV** from 75 mm to 630 mm can be drilled under **medium pressure (water) of maximum 6 bar** and a **medium temperature of 10–60 °C**.

aquatherm Prefabrication

Advantages aquatherm Prefabrication: Planning, fabrication and service

Investors

- Support from planning to commissioning
- Service technicians provide advice and support on site
- Development of customized solutions
- Time- and cost savings due to pre-fabrication
- Cost transparency
- Quick and easy installation into existing systems
- Reduce dead-time
- Over 40 years of proven quality and experience
- Insurance cover up to 20 million Euros per individual case

Architects and planners

- Planning support from the aquatherm design team
- Support for the plausibility and completeness check
- Provision of CAD and planning data
- Detailed planning data for testing and production release
- 3D drawings minimize design errors
- Early detailed planning means planning and cost reliability
- High precision of the components due to pre-fabrication
- Time saving through pre-fabrication
- Years of experience in manifold and plant construction

Advantages of aquatherm manifolds and special components

- Consistent quality by industrial prefabrication „Made in Germany“
- Certified and inspected – ISO 9001/ISO 14001/ISO 50001
- Resistance to corrosion, chemicals and aggressive media
- Pre-insulated available
- Thinner insulation
- UV-resistance available
- Heat-/sound-insulating properties
- Oxygen-tight¹
- Hygienic²
- Weight reduction due to the use of PP-R
- No silting by corrosion products
- Less pipe roughness and high abrasion resistance
- High impact strength
- Tight connection of pipe and fitting by fusion
- Three-layer pipe structure with glass fiber-reinforced middle-layer
- Flame resistant according to DIN 4102-1, building material class B 1³
- Recyclable
- Durable

Plumbers/Plant engineers

- High, tested quality with a 10 years warranty
- Support and advice of service technicians on site
- Highest accuracy due to detailed planning
- Order monitoring and delivery by the specialized wholesale
- No delays due to missing parts
- Low tooling costs
- Rapid add-on by aquatherm saddle-technique
- Weight reduction due to the use of PP-R, thus easier handling during transport and on site
- No improvise on site
- Fast installation times
- Installation in confined spaces is possible
- Compensation of skills shortage
